RE: Preliminary Alternate Liner Demonstration  
DTE Electric Company Belle River Power Plant  
Bottom Ash Basins Coal Combustion Residuals Unit  
4505 King Road, China Township, Michigan

Dear Administrator Regan:

The DTE Electric Company (DTE Electric) is submitting the enclosed preliminary Alternate Liner Demonstration (ALD) to the U.S. Environmental Protection Agency (EPA) as a “place holder” and out of an abundance of caution to meet the November 30, 2021 date for submitting ALDs under the Part B rule.

As EPA has publicly acknowledged, the EPA has experienced unanticipated internal delays in reviewing and making decisions on the Part B applications that were submitted a year ago on November 30, 2020, and that this extended delay has practically eliminated the timeframe contemplated in the Part B rule for facilities to prepare their ALDs. Given this, EPA explains on their CCR Part B Implementation web page that they intend to “take actions to ensure that any facility approved to conduct a demonstration has the same amount of time anticipated by the current regulation to initiate and complete the demonstration after an approval.”

DTE Electric appreciates EPA’s commitment to take this corrective action and believes it is both necessary and appropriate. Regardless of the Agency’s internal delays DTE Electric proceeded expeditiously with the hydrogeological site characterization and laboratory study as detailed in the September 1, 2021 extension request due to analytical limitations. The extension request detailed the compatibility laboratory testing program results as of late August 2021, and projected termination criteria to be met by March 23, 2022. EPA has not yet responded to the extension request.

The enclosed preliminary ALD prepared by Geosyntec using preliminary data, concludes that the low permeability natural clay soils underlying the Belle River Power Plant Bottom Ash Basins are consistently present across the basin and have sufficiently low hydraulic conductivity to prevent groundwater contamination at the solid waste boundary through the active life of the unit.

As allowed by the agency, electronic files were submitted to Richard Huggins, Mary Jackson, Michelle Long, and Jason Mills via email. If you have any questions regarding this submittal, please contact me at 313.235.0153 or [christopher.scieszka@dteenergy.com](mailto:christopher.scieszka@dteenergy.com)

Sincerely,

Christopher Scieszka  
Project Manager, Environmental Management and Safety, DTE Energy

## 1. INTRODUCTION

This report has been prepared to provide the Preliminary Alternate Liner Demonstration (ALD) of Belle River Power Plant Bottom Ash Basins (BABs), one of two coal combustion residuals (CCR) units at the site, in accordance with 40 CFR Part 257 as amended on November 20, 2020 (CCR Rule). **Figure 1-1** provides a site location.

This report concludes that there is no reasonable probability that water from BABs will cause releases to groundwater throughout its active life that will exceed the groundwater protection standard at the waste boundary over the projected active life of the CCR unit.

### 1.1 Background

DTE Electric Company (DTE) submitted the Alternate Liner Demonstration Application for BABs to the United States Environmental Protection Agency (USEPA) on November 30, 2020 [1] in accordance with the CCR Rule. Soon after, DTE started the field and laboratory investigation studies to meet the requirements of the CCR Rule.

One of the requirements of the CCR rule is to conduct hydraulic conductivity testing using site-specific permeant liquid. The CCR Rule acknowledges that these tests may last long such that the operator of the CCR unit may need to submit an extension request for the laboratory testing program, and submit a preliminary ALD.

DTE submitted an extension request due to “analytical limitation” under a separate cover, dated September 1, 2021 [2]. The extension request detailed the compatibility testing program results as of late August 2021, and projected termination criteria to be met by March 23, 2022. The EPA has not yet responded to the extension request.

### 1.2 Purpose

The purpose of this report is to provide ALD approach, analysis details, and present results based on available data in accordance with the CCR Rule. Although the Part B Rule does not require the submittal of a preliminary ALD by November 30, 2021 if an extension request is submitted in accordance with §257.71(d)(2)(ii)(A), DTE is providing this preliminary ALD as a “place holder” and out of an abundance of caution and with confidence in the performance of the liner system to comply with the requirement to submit an ALD by November 30, 2021. A final ALD will be submitted in accordance with the schedule expected to be included in the forthcoming EPA decisions.

### 1.3 Report Organization

The remainder of this report is organized as follows:

- Section 2 – provides the field and laboratory investigation details, information on site geology/hydrogeology, and conceptual site model details.
- Section 3 – provides results of hydraulic conductivity testing, termination criteria details, chemistry testing of site-specific water, and discussion of results.
- Section 4 – provides analysis approach, details, groundwater protection standards, and evaluation of results as to whether BABs meet the ALD requirement of the CCR Rule.
- Section 5 – provides a summary of the report.
- Section 6 – provides certification.
- Section 7 – provides references.

#### **1.4 Terms of Reference**

This report was prepared by Mike Coram C.P.G., Omer Bozok P.E., Jesse Varsho P.E., and reviewed by John Seymour, P.E. of Geosyntec.

## 2. CHARACTERIZATION OF SITE HYDROGEOLOGY

The CCR Rule requires the following:

*§257.71(d)(ii)(A) Characterization of site hydrogeology. A characterization of the variability of site-specific soil and hydrogeology surrounding the surface impoundment that will control the rate and direction of contaminant transport from the impoundment. The owner or operator must provide all of the following as part of this line of evidence:*

*(1) Measurements of the hydraulic conductivity in the uppermost aquifer from all monitoring wells associated with the impoundment(s) and discussion of the methods used to obtain these measurements;*

*(2) Measurements of the variability in subsurface soil characteristics collected from around the perimeter of the CCR surface impoundment to identify regions of substantially higher conductivity;*

*(3) Documentation that all sampling methods used are in line with recognized and generally accepted practices that can provide data at a spatial resolution necessary to adequately characterize the variability of subsurface conditions that will control contaminant transport;*

*(4) Explanation of how the specific number and location of samples collected are sufficient to capture subsurface variability if:*

*(i) Samples are advanced to a depth less than the top of the groundwater table or 20 ft beneath the bottom of the nearest water body, whichever is greater, and/or*

*(ii) Samples are spaced further apart than 200 ft around the impoundment perimeter;*

*(5) A narrative description of site geological history; and*

*(6) Conceptual site models with cross-sectional depictions of the site environmental sequence stratigraphy that include, at a minimum:*

*(i) The relative location of the impoundment with depth of ponded water noted;*

*(ii) Monitoring wells with screening depth noted;*

*(iii) Depiction of the location of other samples used in the development of the model;*

*(iv) The upper and lower limits of the uppermost aquifer across the site;*

*(v) The upper and lower limits of the depth to groundwater measured from monitoring wells if the uppermost aquifer is confined; and*

*(vi) Both the location and geometry of any nearby points of groundwater discharge or recharge (e.g., surface waterbodies) with potential to influence groundwater depth and flow measured around the unit.*

## **2.1 Introduction**

This section provides information on site geology and hydrogeology, data used in site characterization, a summary of ALD-specific field and laboratory study, and a conceptual site model built using the Environmental Visualization System (EVS).

## **2.2 Site Geology**

The surficial topography of St. Clair County is characterized by a low-relief floodplain, stream terrace, and lakeshore deposits. The subsurface geology of the area is defined by glacial deposits, which range in thickness from 100 to 400 ft thick. These glacial sediments, including lacustrine, till, and sand and gravel outwash deposits, were deposited on the underlying bedrock. Throughout St. Clair County the underlying bedrock varies but is primarily fine-grained siliclastic rock, mostly shale with some sandstone [1].

The St. Clair River is the major surface water body in the county and runs along the eastern boundary of the county. Shallow regional groundwater flow would be expected to be to the east towards the St. Clair River. The BABs CCR Unit is located approximately one mile west of the St. Clair River.

### **2.2.1 Bottom Ash Basin Site-Specific Geology**

The geology of St. Clair County consists of approximately 100 to 400 ft of glacial deposits, primarily lacustrine deposits, till, and, to a lesser extent, sand and gravel outwash, overlying a variety of bedrock surfaces. The glacial material underlying the BABs appears to be glaciolacustrine clays with local sand lenses. The uppermost aquifer unit (sandy rich interval) appears to be deposits from glaciofluvial outwash deposited directly above the bedrock surface.

The BABs CCR Unit is underlain by more than 100 ft of unconsolidated sediments, with the lower confining Bedford Shale generally encountered from 140 to 150 ft below ground surface (bgs). In general, the BABs CCR unit is initially underlain by approximately 90 ft in the western portion of the BABs and 130 ft in the eastern portion of the BABs of laterally extensive low hydraulic conductivity clay-rich deposits. During Geosyntec's ALD investigation in December 2020, cone

penetration test (CPT) dissipation tests were performed to determine hydraulic conductivity of the underlying clay-rich deposits, the results of the dissipation tests are summarized in Section 2.5.1. The CPT data confirm that the underlying deposits are consistently low hydraulic conductivity units.

The uppermost aquifer unit is a confined, sand-rich interval (within the footprint of the BABs) that directly overlies the Bedford Shale. It is thicker in the western portion of the BABs and decreases to the southeast. From west to east/southeast the uppermost aquifer increases in fines from a sandy unit to a silty unit. For the purposes of this report, the saturated unit directly overlaying the Bedford Shale (sandy and silty) is considered the “uppermost aquifer unit”. It is further discussed in **Section 2.6**.

### **2.3 Uppermost Aquifer Field Testing and Hydrogeology**

TRC calculated the hydraulic conductivities within the CCR monitoring wells set within the upper portion of the uppermost aquifer using single well hydraulic conductivity tests (e.g., slug tests) performed in 2016 and 2021 by TRC. Test results are provided in **Appendix A** and included in the EVS model. The monitoring well logs and construction details are presented in **Appendix B**. As calculated by TRC, the hydraulic conductivity of the uppermost aquifer using wells at the BABs CCR Unit area is approximately 1.2 ft/day (4E-4 cm/s).

### **2.4 Summary of Data Used for Site Characterization**

A host of data from three separate investigations was used to characterize the subsurface stratigraphy and soil characteristics for the site. Historical investigations included a 1973-1974 investigation performed by Bechtel and a 2016 investigation performed by TRC, all of which are included in the initial ALD Application [1]. Data from the 2020 ALD Investigation performed by Geosyntec was used to augment the data set. In total, these three investigations included 56 investigative locations that included 22 soil borings, 13 monitoring wells and 16 CPTs. **Figure 2-1** provides investigation locations.

Boring logs for the 1970s, 2016, and 2020 field investigations are provided in **Appendices C** through **E**, respectively. These investigations extend across the site and include BABs and Diversion Basin (DB), which is another CCR unit connected to BABs (~ 400 ft southeast of BABs). Considering the proximity of both CCR units, field investigation data is used for both CCR units.

Field testing included pocket penetrometer tests on fine-grained soils, slug tests for the monitoring wells screened in the uppermost aquifer, and pore pressure dissipation tests (PPDs) at CPT locations. Lab testing included grain size distributions, Atterberg limits, water content, dry and/or total unit weight, specific gravity, and hydraulic conductivity testing. Type of tests, standards and

number of tests are summarized in **Table 2-1**. Laboratory test results are provided in **Appendices F through H** for the 1970s, 2016, and 2020 laboratory studies, respectively.

Considering the extent of existing field investigation data, it is Geosyntec's opinion that the data used in building this model is sufficient to capture the variability that may exist in soil conditions.

## **2.5 ALD-Specific Site Investigation Details**

The scope of work for the ALD-Specific Site Investigation (SI) was completed in December 2020 and included drilling and sampling and advancing a CPT probe through the embankment and native soils. The purpose of the fieldwork was to obtain nominally undisturbed samples for hydraulic conductivity testing and to augment the existing data set to characterize the alternate liner materials in accordance with the CCR Rule. Investigations were conducted generally at 200-ft intervals but adjusted in the field as necessary to avoid underground utility lines, overhead power lines, and access issues, as needed. Investigations extended down to 100 ft bgs to an elevation approximately 490 ft, which is lower than groundwater level, and 20 ft below the nearest water body that is St. Clair River with a bottom elevation of approximately 525 ft.

The following sections provide a summary of the fieldwork completed during the SI.

### **2.5.1 Cone Penetrometer Tests**

Eight CPTs were completed around the berms of the BABs in 200 ft intervals to characterize the BABs embankment and native soils. Similarly, seven CPTs were completed around DB. The CPT locations are provided in **Figure 2-1**. CPTs were advanced from the ground surface to refusal or to approximately 100 ft bgs. Pore pressure dissipation tests were conducted to estimate in-situ hydraulic conductivity at select depths; at a minimum, these tests were conducted near the sonic borings and at the elevation near where undisturbed samples were collected for laboratory hydraulic conductivity testing.

In total, 16 dissipation tests were completed at CPTs advanced around BABs, and 12 dissipation tests were completed at CPTs advanced around DB. Hydraulic conductivity values were estimated to range between 9.76E-9 cm/s and 2.81E-6 cm/s around BABs, and range between 7.97E-9 cm/s and 1.63E-6 cm/s around DB. Hydraulic conductivity values are similar between soils underlying BABs and DB. Results are summarized in **Table 2-2**. These values are consistent with TRC's 2018 Natural Clay Liner Equivalency Evaluation Report [1]. CPT logs are provided in **Appendix I1**, and PPD tests are provided in **Appendix I2**.

### **2.5.2 Sonic Drilling**

In December 2020, six soil borings were advanced at the site to evaluate the subsurface geology, collect undisturbed samples for hydraulic conductivity testing, and collect additional soil samples

for characterization of native soils and the embankment. Soil samples were collected continuously in two to ten-foot sections from the ground surface to the termination of the soil boring. Geosyntec staff were present to log each boring and describe the soil samples in accordance with the Unified Soil Classification System (USCS). Shelby tubes were collected from the BABs embankment soils, and native soils at approximately 20 ft intervals from each of the sonic borings in accordance with ASTM D1587<sup>1</sup>. The soil borings were advanced to depths of approximately 100 ft-bgs to within the first encountered uppermost aquifer and/or into the top of the underlying shale bedrock. Sonic drilling locations are provided in **Figure 2-1**. Boring logs are provided in **Appendix E**. Soil stratigraphy is discussed in Section 2.6.

### 2.5.3 Laboratory Testing

A suite of index testing and hydraulic conductivity testing was conducted on select soil samples. Fourteen soil samples were collected from six borings for hydraulic conductivity testing from depths between five ft and 90 ft to capture soil conditions ranging from soft to very stiff soils. Details of hydraulic conductivity testing are provided in Section 3.

Index testing included:

- 24 Moisture Content tests (ASTM D2216)
- 4 Specific Gravity tests (ASTM D854)
- 22 Grain Size Mechanical Sieve tests (ASTM D6913)
- 21 Atterberg Limits tests (ASTM D4318)

Note that these tests quantities are included in **Table 2-1**. Test results are provided in **Appendix H**.

## 2.6 Conceptual Site Model

An EVS model was developed for the site based on data collected during the field investigations from the 1970s, 2016, and 2020. The EVS model centralized all the data to develop a comprehensive Conceptual Site Model (CMS). Based on the EVS model, the overall CMS of the Site lithology is relatively consistent with a low hydraulic conductivity clay-rich deposits with non-interconnected sand seams at deeper depths. Within the BABs CCR unit, the uppermost

---

<sup>1</sup> ASTM D1587 – Standard Practice for Thin-walled Tube Sampling for Fine-grained Soils.

aquifer unit sits directly above the bedrock and appears to thin and increase in silt from west to east/southeast across the BABs CCR unit.

Specific to the BABs CCR unit, Cross-sections (**Figures 2-2 through 2-7**) were created from the EVS model and analyzed to determine the various changes in lithology within the clay confining unit directly underlying the BABs and the characteristics of the upper aquifer unit which sits directly on the bedrock. Upon review of the transects, the lithology beneath the BABs consists of (from the ground surface down) (1) clay, (2) clay with sand, (3) uppermost aquifer unit, and (4) shale bedrock. These units are consistent with historical reports and TRC's November 2020, Initial Application for Alternate Liner Demonstration [1]. There were some discrepancies, in that the second clay unit was described as silty instead of sandy. Based on CPT and geotechnical index testing during Geosyntec's 2020 ALD investigation, the lower clay was re-interpreted as "clay with sand" mainly due to sand seams that were encountered. The clay within the "clay with sand" unit is relatively consistent stiff gray clay. Therefore, the lithology directly underlying the BABs consist of the following:

- (1) Clay – 50 to 60 ft thick directly beneath the BABs. This unit consists of mainly soft to medium stiff clay and minimal sand seams. None of the sand seams are interconnected or considered aquifer unit.
- (2) Clay with sand – This unit was encountered at approximately 50 to 60 ft bgs. Increasing thickness from west to east. At the west end of the BABs, this unit is approximately 40 ft thick and increases in thickness to 80 ft thick at the eastern edge of the BABs. This unit consists of stiffer gray clay with increasing sand seams. Although there are more frequent sand seams, most are less than 1 foot in thickness and have hydraulic conductivity values greater than  $1 \text{ E-7 cm/s}$  except for one location which is discussed in more detail below. The data supports that none of the sand seams are interconnected or considered an aquifer unit. Consequently, because the sands are isolated, the unit behaves like a low hydraulic conductivity clay unit.
- (3) Uppermost Aquifer Unit –This unit was encountered at approximately 90 ft bgs in the west and increases in depth to 140 ft bgs to the east. The thickness of the unit corresponds to the overlying unit and thins from west to east and directly sits atop the bedrock. The thickness changes from approximately 50 ft thick in the western edge of the BABs to ten ft thick in the eastern/southeastern edge of the BABs. This sandy unit is saturated and considered the uppermost aquifer unit within the BABs CCR unit. There is a transition from sandy aquifer beneath the BABs CCR unit to a thin saturated silty aquifer south/southeast of the BABs. Specifically, this silty aquifer extends beneath the DB and both are considered the "uppermost aquifer unit" on the cross sections and within the EVS model.

- (4) Shale bedrock – This unit was encountered at approximately 140-150 ft bgs.

During Geosyntec's 2020 investigation, CPT tests were conducted, and dissipation tests were completed at CPT-01B, CPT-03, and CPT-06 to estimate the hydraulic conductivity of the lithology. In addition, laboratory testing was conducted on individual grab samples from the three sonic borings around BABs for long-term breakthrough potential and is further discussed in Section 3. Based on the review of the CPT dissipation data (as discussed in Section 2.5.1 and Section 3), values ranged from  $9.76\text{E-}9$  cm/s to  $2.81\text{E-}6$  cm/s. The CPT-derived highest hydraulic conductivity value of  $2.81\text{E-}6$  cm/s was calculated at CPT-03 from a sand seam at 510 ft AMSL (approximately 80 ft bgs) within the (2) clay with sand unit. Dissipation tests at CPT-03 directly above and below the sand seam indicated hydraulic conductivities less than  $1\text{E-}7$  cm/s. Therefore, the (1) clay and (2) clay with sand lithologies beneath the BABs have adequate hydraulic conductivity values to be considered a low hydraulic conductivity unit and is consistent with TRC's 2018 Natural Clay Liner Equivalency Evaluation Report [1].

Below the clay with sand is the uppermost aquifer unit that mainly consists of sand. This unit directly overlies the Bedford shale and decreases in thickness from west to south/southeast across the BABs. In the western portion of the BABs, the uppermost aquifer unit is approximately 50 ft thick (near MW-16-01) and thins to approximately 10 ft thick to the southeast. Beyond the BABs CCR unit, the EVS model predicts this unit extending to the DB CCR unit with increasing fines/silts. The hydraulic head in the (3) uppermost aquifer unit associated with the BABs is approximately 574 ft AMSL (TRC 2018a) with an almost flat horizontal gradient.

The bottom of the BABs is at an elevation of approximately 580 ft and the bottom of the clay underlying the BABs is at an elevation of approximately 500 ft (western portion), thus more than 80 ft of low hydraulic conductivity clay-rich deposits ((1) clay and (2) clay with sand) separate the bottom of the BABs CCR unit from the underlying (3) uppermost aquifer unit.

### 3. POTENTIAL FOR INFILTRATION

The CCR Rule requires:

*§257.71(d)(ii)(B) Potential for infiltration. A characterization of the potential for infiltration through any soil-based liner components and/or naturally occurring soil that control release and transport of leachate. All samples collected in the field for measurement of saturated hydraulic conductivity must be sent to a certified laboratory for analysis under controlled conditions and analyzed using recognized and generally accepted methodology. Facilities must document how the selected method is designed to simulate on-site conditions. The owner or operator must also provide documentation of the following as part of this line of evidence:*

- (1) The location, number, depth, and spacing of samples relied upon is supported by the data collected in paragraph (d)(1)(ii)(A) of this section and is sufficient to capture the variability of saturated hydraulic conductivity for the soil-based liner components and/or naturally occurring soil;*
- (2) The liquid used to pre-hydrate the samples and measure long-term hydraulic conductivity reflects the pH and major ion composition of the CCR surface impoundment porewater;*
- (3) That samples intended to represent the hydraulic conductivity of naturally occurring soils (i.e., not mechanically compacted) are handled in a manner that will ensure the macrostructure of the soil is not disturbed during collection, transport, or analysis; and*
- (4) Any test for hydraulic conductivity relied upon includes, in addition to other relevant termination criteria specified by the method, criteria that equilibrium has been achieved between the inflow and outflow, within acceptable tolerance limits, for both electrical conductivity and pH.*

#### 3.1 Soil Sample and Site-Specific Water Details

##### 3.1.1 Soil Samples for Hydraulic Conductivity Testing

Fourteen soil samples were collected for hydraulic conductivity testing. Considering the extent of existing field investigation data, including CPTs, earlier borings, Geosyntec believes that the collected samples are sufficient to capture the variability of hydraulic conductivity in natural soils.

##### 3.1.2 Site-Specific Water Testing and Results

Site-specific CCR porewater samples were collected from both BABs and the DB for geochemical analyses to determine the representative composition of an “aggressive” solution for use in the

compatibility portion of the hydraulic conductivity testing. Due to the high turbidity of basin waters, samples were filtered through a 0.45-micron filter to evaluate dissolved concentrations. Site-specific water samples were tested for CCR Rule Appendix III and Appendix IV parameters as well as additional major cations (sodium, magnesium, potassium), anions (total alkalinity), iron, and manganese.

All water samples were found to be slightly basic, with pH concentrations ranging from 7.87 to 9.01 SU. TDS concentrations of all three samples are similar, ranging from 200 to 300 mg/L. All three samples have TDS concentrations < 1000 mg/L, which is defined by the United States Geological Survey (USGS) as “freshwater”. BABs and DB samples have similar major ion compositions, as illustrated on the Piper diagram in **Figure 3-1**. The anion composition is very similar for all three samples and consists of predominantly sulfate with some alkalinity and very little chloride. The cation composition is predominantly calcium and monovalent cations (potassium/sodium), with a smaller proportion of magnesium. The DB sample has a slightly higher relative percentage of calcium and lower monovalent cations compared to the BABs samples.

The analytical results are provided in **Appendix J** and tabulated in **Table 3-1**. Results were used to calculate total ionic strength for each sample. Total ionic strength is a measure of the combined ion concentrations in a solution and can represent the salinity of a sample. Total ionic strength was calculated for each sample using geochemical modeling software Geochemist’s Workbench (GWB) v12.0.4. The GWB thermodynamic dataset ‘thermo.com.V8.R6\_.tdat’ was used for the calculations in order to incorporate all tested parameters. Analytical results for each parameter were input into GWB in units of milligrams per liter (mg/L) and the ionic strength of each sample was calculated in units of molality (m).

Both BABs samples contained similar ionic strength values (0.0088 and 0.0080 m) compared to the slightly higher ionic strength of the DB sample (0.0106 m). Thus, the DB sample is considered to be the more aggressive solution and was used for compatibility testing as described in Section 3.2.

### **3.2 Hydraulic Conductivity Testing Procedure and Termination Criteria**

All 14 soil samples were tested for hydraulic conductivity,  $k$  using deionized water in accordance with ASTM D5084 [3] to establish a baseline  $k$  reading. Then, six of the samples exhibiting high and low  $k$  values were selected for compatibility testing in accordance with ASTM D7100 [4] using site-specific water. The use of ASTM D7100 is discussed in the preamble of the CCR Rule and deemed appropriate by USEPA.

ASTM D7100 termination criteria require the following conditions:

- The ratio of outflow to inflow is between 0.75 and 1.25. The hydraulic conductivity is considered steady if four or more consecutive hydraulic conductivity determinations fall within  $\pm 25\%$  or better of the mean value for hydraulic conductivity,  $k \geq 3E-8$  cm/s or within  $\pm 50\%$  or better for  $k < 1E-8$  cm/s, and a plot or tabulation of the hydraulic conductivity versus time shows no significant upward or downward trend;
- At least 2 pore volumes (PV) of flow have passed through the sample; and
- pH and electrical conductivity of effluent, is within 10% of that for the influent with no significant increasing or decreasing trends

### 3.3 Hydraulic Conductivity Test Results and Assessment

Preliminary results are provided in **Appendix K** as of August 20, 2021 and summarized in **Table 3-2**. The table provides sample ID, the start date for testing, amount of flow passed through a sample for a given duration of time, hydraulic conductivity values, and projected date for completing 2 PV of flow.

In addition, a set of figures created for each sample providing insight into the progression of:

- PV of flow with time.
- hydraulic conductivity with time.
- hydraulic conductivity with PV;
- pH of inflow and outflow with time; and
- Electrical conductivity (EC) with time.

Progression of different parameters is provided from **Figure 3-2** through **3-31**.

Overall, the hydraulic conductivity,  $k$  value of samples range between  $8.2E-09$  and  $2.8E-08$  (cm/s). The amount of PV of flow that has passed through the samples ranges from 0.8 to 2.3. As of August 20, 2021, two of the samples have reached the 2 PV criteria. The remaining samples are projected to reach 2 PV March 2022; this is based on linear extrapolation between PV at known dates and assumes  $k$  stays relatively constant. Overall, the PV of flow is progressing linearly towards the 2 PV criteria. Hydraulic conductivity values are generally flat and can be considered steady.

pH values are provided in **Table 3-3**. In general, the average pH of inflow ranges from 8.2 to 8.4, and the average pH of outflow ranges from 8.1 to 8.4. The pH of outflow is within 10 percent of inflow.

EC values are provided in **Table 3-4**. In general, the average EC of inflow ranges from 609 to 680, and the average EC of outflow ranges from 778 to 2146. The EC of outflow are not within the 10 percent of inflow; they are projected to meet the termination criterion by the end of December 2021. This date is based on the convergence of linear extrapolations of the data.

**Table 3-5** summarizes if the sample has reached the termination criterion for PV, pH, EC, and the approximate projected date for reaching the termination criteria. As summarized in the table, samples have not reached all the termination criteria; pH has achieved termination criterion, and two of the samples have reached the PV criterion; none of the samples have reached the EC criterion. Based on available data, Geosyntec expects the last sample to reach termination criteria by the end of March 23, 2022.

The results do not include inflow vs outflow data. The main reason is that the project team had decided to keep the inflow constant, which provides more stable gradient across the sample, more accurate estimation of  $k$ , faster testing, and more control in the testing procedure. It is Geosyntec's opinion that the inflow/outflow criterion would be reached by the time other criteria is reached.

#### 4. FATE AND TRANSPORT MODEL ANALYSES

The CCR Rule requires:

*§257.71(d)(ii) (C) Mathematical model to estimate the potential for releases. Owners or operators must incorporate the data collected for paragraphs (d)(1)(ii)(A) and (d)(1)(ii)(B) of this section into a mathematical model to calculate the potential groundwater concentrations that may result in downgradient wells as a result of the impoundment. Facilities must also, where available, incorporate the national-scale data on constituent concentrations and behavior provided by the existing risk record. Application of the model must account for the full range of site current and potential future conditions at and around the site to ensure that high-end groundwater concentrations have been effectively characterized. All the data and assumptions incorporated into the model must be documented and justified.*

*(1) The models relied upon in this paragraph (d)(1)(ii)(C) must be well- established and validated, with documentation that can be made available for public review.*

*(2) The owner or operator must use the models to demonstrate that, for each constituent in appendix IV of this part, there is no reasonable probability that the peak groundwater concentration that may result from releases to groundwater from the CCR surface impoundment throughout its active life will exceed the groundwater protection standard at the waste boundary.*

*(3) The demonstration must include the peak groundwater concentrations modeled for all constituents in appendix IV of this part attributed both to the impoundment in isolation and in addition to background.*

##### 4.1 Introduction

A fate and transport model analysis have been performed to evaluate whether the peak groundwater concentrations that may result from releases to the groundwater from the BABs exceeds the groundwater protection standards (GWPS) at the waste boundary throughout its active life.

The model considers flow of CCR pore water Constituents of Concern (COCs) migrating through the bottom of CCR unit down to the uppermost aquifer. The model does not consider additional migration of COCs horizontally to the waste management boundary. If considered, the horizontal groundwater flux would reduce the concentrations of the COCs; consequently, the model presents a conservative assessment. As discussed later in Section 4.6.1 the results of the model predicts COCs concentrations that are very low such that there is no reasonable probability that water from BABs will cause releases to groundwater throughout its active life that will exceed the groundwater protection standard at the waste boundary over the projected active life of the CCR unit.

## 4.2 Groundwater Protection Standards

Groundwater samples from TRC's 2016 and 2017 sampling events were tested for Appendix IV COC and represent eight rounds of background groundwater data. The data were used to calculate site-specific background levels (Background) for Appendix IV COC. **Appendix L** provides the memorandum describing the statistical calculations.

To develop GWPS for the ALD assessment, the federal Maximum Contaminant Level (MCL), Regional Screening Levels, and Background (whichever is higher) were evaluated and the highest value was selected as the GWPS in accordance with the CCR Rule. Where MCL are not available Regional Screening Levels were used. GWPS are provided in **Table 4-1**.

## 4.3 Consideration of Background Groundwater Concentrations

The background has been considered and is a factor when determining if GWPS has been exceeded. At the BABs, naturally occurring background concentrations are generally much lower than the GWPS. The predicted groundwater concentrations and peak groundwater background concentrations are further discussed in Section 4.6.1.

## 4.4 Leachate Quality Results

Porewater (i.e. leachate) quality samples from BABs and the DB were collected in December of 2020 and January of 2021; samples were analyzed for Appendix III and IV parameters by ALS Environmental in Holland, MI. Analytical results were compared for each parameter and the highest leachate concentration was used as the established concentration of the constituent ( $C_o$ ) when calculating the predicted groundwater concentrations ( $PGC_i$ ), as discussed further in this Section. The leachate quality data is summarized in **Table 4-2**.

In addition to the site-specific leachate concentrations, 90<sup>th</sup> percentile concentrations from the 2014 EPA study [5] were considered in the analysis. This data is summarized in **Table 4-2**.

## 4.5 Fate and Transport Model

### 4.5.1 Analysis Model

A one-dimensional fate and transport model was designed to further understand the potential for contaminant transport from the CCR units to the uppermost aquifer. The model was developed with a contaminant transport process through the clay and clay with sand layers under the BABs. Contaminant transport processes are discussed in Section 4.5.2.1 below.

The modeling program POLLUTE [6] was selected for the one-dimensional fate and transport evaluation. The data input for POLLUTE acquires all the input parameters, performs calculations

for individual transport processes, and then uses the semi-analytical solution for the various transportation process (see Section 4.5.2) to yield predicted concentrations at the various specified times and distances.

Model setup and inputs are discussed in detail in the following sections and are summarized via layers in **Figure 4-1**.

## 4.5.2 Proposed Mathematical and Associated Computer Model

### 4.5.2.1 *Mathematical Model*

The potential transport mechanisms that may occur at the BABs for the various modeled layers include advection, mechanical dispersion and diffusion. For porous media, these transport mechanisms can be represented by the following one-dimensional flow equation [7]:

$$\textbf{Equation No. 1:} \quad n \frac{\delta c}{\delta t} = nD \frac{\delta^2 c}{\delta z^2} - V_{\alpha} \frac{\delta c}{\delta z} - \rho K_d \frac{\delta c}{\delta t} - n\lambda c$$

Where:

c = concentration at any point

D = Coefficient of hydrodynamic dispersion in the vertical direction

n = porosity of the geologic layer

K<sub>d</sub> = distribution coefficient

V<sub>α</sub> = Darcy Velocity in the vertical direction

ρ = dry density of soil

λ = decay constant of the contaminant species

t = time

POLLUTE utilizes the transport phenomena as governed by Equation No. 1

### 4.5.2.2 *Predicted Groundwater Concentrations*

This model uses an initial concentration value of one (1), which represents a unit concentration of any constituent in the leachate. The results from the model can thus be used as a prediction factor for estimating the future concentration of any constituent of concern in groundwater. Multiplying the output prediction factor by the initial leachate concentration provides the predicted

groundwater concentration at the end of the model run. The following equation (Equation No. 2) illustrates this concept:

$$\textit{Equation No. 2:} \quad \text{PGC}_t = \text{PF}_t * \text{C}_o$$

Where:

$\text{PGC}_t$  = predicted groundwater concentration after t years.

$\text{PF}_t$  = prediction factored after t years, which is the output of the model.

$\text{C}_o$  = established leachate concentration of the constituent of concern.

### 4.5.3 Fate and Transport Model Inputs

#### 4.5.3.1 *Initial Leachate or Source Concentration*

The initial leachate concentration input value used was one (1). This value is unitless because it represents unit leachate concentration of any given constituent. Therefore, the model results represent a fraction of the initial leachate concentration for any constituent.

#### 4.5.3.2 *Number of Layers and Layer Thickness*

Two layers were modeled at the site: the clay layer and the clay with sand layer. At the BABs, the clay layer has an average thickness of 40 ft; the clay with sand layer has an average thickness of 63 ft. The average thickness of each layer was derived from an isopach map generated by subtracting the surface representing the bottom of the layer from the surface representing the top of the layer, and averaging the difference over the extent of the footprint of the BABs; model documentation for the average thickness of each layer can be found in **Appendix M**.

POLLUTE also allows layers to be subdivided into sublayers, which allows the predicted concentration distribution within a layer to be calculated. The clay layer was divided into 25 sublayers at the BABs. The clay with sand layer was divided into 40 sublayers at the BABs.

#### 4.5.3.3 *Modeling Period*

The model was run for the operating period of 55 years. This modeling period captures the amount of time elapsed from the 1980s, when CCR unit(s) operations started, to 2034, which is the end of the projected active life of BABs.

#### 4.5.3.4 *Talbot Parameters*

POLLUTE uses a Laplace transform to find the solution to the advection-dispersion equation. The numerical inversion of the Laplace transform depends on the Talbot parameters. The model provides default values for the parameters or they can be selected by the user. The default Talbot parameter were used in this demonstration [8].

#### 4.5.3.5 *Boundary Conditions*

POLLUTE allows the user to select between multiple upper and lower boundary conditions. The top boundary condition typically represents the bottom of CCR unit as a potential source. The top boundary can be specified as either zero flux, constant concentration, or finite mass. A constant concentration was assumed as it provides conservative model results since it assumes that the leachate quality will remain constant at the maximum measured values over time.

The lower boundary can be specified as either zero flux, constant concentration, fixed outflow, or infinite thickness. For this model, an infinite thickness lower boundary was used; thus, the model output is a prediction factor of contaminant concentration in groundwater at the interface between the clay with sand layer and the underlying uppermost aquifer.

#### 4.5.3.6 *Darcy Vertical Velocity*

POLLUTE requires a Darcy velocity to be input for the model as a whole. The Darcy velocity was calculated for each basin using a vertical gradient and the vertical hydraulic conductivity of the clay with sand layer. For the BABs, the vertical gradient was calculated using hydrogeologic data from the uppermost aquifer and the normal water elevation as controlled by the outflow structure within the CCR surface impoundment. These parameters were chosen to produce a conservative value for the Darcy velocity. Darcy velocity value of 1.02E-3 m/year was calculated for the BABs as provided in **Appendix M**. The hydraulic conductivity value used for the calculation of Darcy velocity is the average (geometric mean) of historical and current lab testing program vertical hydraulic conductivity data.

#### 4.5.3.7 *Hydrodynamic Dispersion Coefficient*

The vertical coefficient of hydrodynamic dispersion is a required input for each layer within the POLLUTE model. The hydrodynamic dispersion coefficient is calculated using Equation No. 3:

$$\text{Equation No. 3: } D = D^* + av$$

Where:

D = the hydrodynamic dispersion coefficient (m<sup>2</sup>/year);

- $D^*$  = the effective diffusion coefficient ( $m^2/year$ ).
- $a$  = the dispersivity (m);
- $v$  = the groundwater seepage velocity (m/year).

For this demonstration, the coefficient of hydrodynamic dispersion value ( $D$ ) of  $0.19 m^2/year$  was input into the model. This value was based on the effective diffusion coefficient ( $D^*$ ) for chloride ( $0.19 m^2/yr$ ), as calculated by Rowe et al. [9]. The coefficient of chloride was chosen as it is considered to have a high capacity for diffusion compared to other constituents of interest, this it is a conservative constituent to model among the constituents of concern.

The second part of Equation 3, ( $av$ ) is related to dispersion. Rowe et al. [9]. Discusses when the seepage velocity ( $1.02E-3 m/year$ ) is low (i.e., clay soils), diffusion will control the parameter hydrodynamic dispersion ( $D$ ) and dispersion is negligible.

#### 4.5.3.8 *Effective Porosity and Density Input*

The average porosity of each model layer was estimated using laboratory data as discussed in Section 2. The model shows good agreement between porosity values and geologic layers, with the overlying clay unit having lower porosities than the underlying clay with sand unit. An average of 46 percent porosity was used for the clay layer, while an average of 42 percent porosity was used for the clay with sand layer.

Based on empirical data provided by Sara (1994) [10], the laboratory porosity data was converted to effective porosities. An effective porosities values of 0.37 and 0.34 for the clay and clay with sand layers were utilized, respectively.

Density values from laboratory testing were also used to determine a suitable model input. The average dry density of  $1,500 kg/m^3$  (94.2 pcf) was assessed from the available data; this value was used in the POLLUTE model.

#### 4.5.3.9 *Adsorption Coefficient and Degradation*

Adsorption and degradation of constituents can play a significant role in the impedance of contaminant migration in the subsurface. Within POLLUTE, the adsorption coefficient simulates the impedance of constituents or sorption of containments in the modeled layers, while degradation simulates the breakdown of contaminants over time. In this model, adsorption and degradation are assumed to be zero, which provides a more conservative model result.

## 4.6 Fate and Transport Analysis Results and Evaluation

### 4.6.1 Fate and Transport Baseline Model Results

The modeling was performed to evaluate predicted groundwater quality based on the hydrogeology of the site. At the BABs, the baseline model calculated a  $PF_t$  of  $2.66E-33$ . With both the  $C_o$  and  $PF_t$  established, the  $PGC_t$  (i.e. predicted concentration) was calculated and compared to the established GWPS for the BABs. As provided in **Table 4-2**, the predicted groundwater quality results, and the 90<sup>th</sup> percentile concentrations from the 2014 EPA study [5] are below the GWPS levels. In addition, the predicted concentrations were added to the highest concentrations that were measured in 2016-2017 groundwater sampling event and compared to the GWPS. The combined results from predicted concentrations and the highest measured concentrations are below the GWPS (see **Tables 4-3**). Therefore, no impacts to groundwater above GWPS are predicted over the duration of BABs' active life.

The driving mechanism for the transport is chemical diffusion, because the advective flow would take more than a thousand years for a water molecule to travel from the bottom of BABs to upper most aquifer. **Appendix M** provides calculations for the time of travel.

The baseline model outputs for the BABs are included in **Appendix N**.

### 4.6.2 Sensitivity Analysis

Many of the model inputs are specific to the site. Given the potential for sampling bias, uncertainty, and natural variation, a sensitivity analysis was conducted to evaluate the impact on the variation of the model inputs. The analysis focused on changes to the model output, or  $PF_t$ , given a variation to a single model input as discussed in the following sections. A summary of the sensitivity analyses model input values is provided in **Table 4-4**. The resulting  $PF_t$  from each sensitivity analysis was compared to a threshold prediction value,  $PF_{\text{threshold}}$ . The  $PF_{\text{threshold}}$  value represents the  $PF_t$  at which impacts to groundwater are predicted for Appendix IV COCs at the top of the uppermost aquifer under the CCR unit; the threshold value is 0.2 for the northern BAB and 0.6 for the southern BAB.  $PF_{\text{threshold}}$  is calculated using the Equation No. 4:

$$\text{Equation No. 4: } PF_{\text{threshold}} = \min \left\{ \frac{GWPS_1}{C_1}, \frac{GWPS_2}{C_2}, \dots, \frac{GWPS_i}{C_i}, \dots, \frac{GWPS_n}{C_n} \right\}$$

Where:

$PF_{\text{threshold}}$  = Threshold Prediction Factor

$GWPS_i$  = Groundwater Protection Standard for Constituent 'i'

$C_i$  = Maximum porewater concentration of the COC 'i'

#### 4.6.2.1 *Darcy Velocity*

A sensitivity analysis was completed to evaluate the impact of Darcy velocity changes. A Darcy velocity of 2.03E-3 m/year was selected as the value to use for this analysis. This value is double the baseline value calculated during this demonstration and thus serves as a suitable value for input to the sensitivity analysis.

#### 4.6.2.2 *Coefficient of Hydrodynamic Dispersion*

Model sensitivity to the coefficient of hydrodynamic dispersion was evaluated by increasing and decreasing the input value by 25%. The initial input value was derived from laboratory testing (Rowe et al., 2004) [9], and thus a 25% increase and decrease is considered a satisfactory variation for sensitivity analysis.

#### 4.6.2.3 *Porosity and Effective Porosity*

Model sensitivity to the porosity and effective porosity was evaluated by increasing and decreasing the input value by the minimum and maximum range of values calculated from the laboratory results.

#### 4.6.2.4 *Layer Thickness*

The isopach maps (**Appendix M**) were used to calculate the maximum and minimum thickness for the clay and clay with sand layers. Using those values as inputs, four additional models were run for each CCR unit to evaluate model sensitivities to layer thickness; in each model only one variable was changed.

#### 4.6.2.5 *Modeling Period*

The modeling period used was 55 years (the “baseline”). To further evaluate the impact of modeling runtime on the resultant PF<sub>t</sub>, one model was run with a modeling period of 85 years, to capture the post-closure care time period, though DTE intends to close the BABs by removal.

#### 4.6.2.6 *Sensitivity Results*

Additional fate and transport model runs were completed to evaluate model sensitivities to changing model inputs. As shown in **Table 4-5** using more conservative model input parameters resulted in PF<sub>t</sub> values ranging from 6.23E-38 to 1.30E-26. This demonstrates that the BABs will not impact groundwater quality assuming conditions more conservative than the baseline scenario. The sensitivity modeling results are presented in **Table 4-5** whereas the model outputs are included in **Appendix N**.

### 4.6.3 Reliability of Computer Model

The computer-based transport model used for this analysis is based on rigorous and proven analytical solutions to the advection-dispersion equation for layered deposits. These equations were derived with the intent of modeling the physical and chemical transport of contaminants from waste impoundments. Widespread use, comprehensive documentation, and abundant publications (Talbot, 1979 [8]; Rowe, 1987 [11]; Rowe and Booker, 1987 [12]; Rowe, 1988 [7]; and Rowe and Booker, 1989 [13]) lend to the versatility of this modeling approach for assessing groundwater impacts. The outputs obtained from models conducted in POLLUTE can be compared to those obtained using other approaches to solving the advection-dispersion equation.

### 4.6.4 Degree of Conservativeness in Model Results

Input parameters for the baseline models were based on site-specific data whenever possible. When not possible, input values were derived from an understanding of the site and relevant peer-reviewed literature. If a high degree of uncertainty was present, conservative input values were selected. A summary of the various conservative assumptions is listed below:

- The maximum measured leachate (i.e., porewater) concentration for each constituent was used for the fate and transport model prediction table;
- Constant leachate concentration or a constant mass was used for the entire modeling period. A specific mass could have been assumed for modeling purposes which would have resulted in decrease leachate concentrations over time but to be conservative the model assumed constant leachate concentration over time;
- Adsorption can significantly reduce the concentrations of metal constituents as they move through soils, especially clays which would retard or slow down migration. To be conservative, the model assumed no adsorption would occur over time;
- Degradation of leachate (input values) through either biologic or chemical process was assumed not to occur during the modelling period. By assuming no degradation, the model overestimates the predicted groundwater quality over time; and
- The CCR Rule requires compliance at the waste boundary. The analysis only considers vertical flow from the bottom of FAB to the top of the uppermost aquifer; the analysis does not consider a 2-D flow towards the waste boundary, which would further lower the predicted concentration levels for COCs.

## 5. SUMMARY

This Preliminary ALD has been prepared to assess if the BABs CCR unit meets the ALD requirements per the CCR Rule. The data included comprehensive field and laboratory investigation data collected from the 1970s to 2020. The 2020 field and laboratory investigation studies were conducted specifically to augment data gaps and to address the CCR Rule requirements. The data were integrated into an EVS model to create a comprehensive CSM to understand the BABs lithology beneath the CCR unit and as a basis for the Fate and Transport analysis. The EVS model was relatively consistent with historic representations of the geology associated with the BABs CCR unit.

Site-specific water was collected from BABs and DB and tested to assess which one of the CCR units had the more aggressive water. Water from DB was deemed to be more aggressive and used for compatibility testing to estimate the impacts on the hydraulic conductivity of soil samples. The testing program is still underway. The most current results from the testing have been used in this ALD.

A comprehensive subsurface stratigraphy model was created using the augmented data set and processing it through the EVS. Following, Fate and Transport analysis was conducted to assess whether there is a reasonable probability that water from BABs may result from releases to groundwater throughout its active life that will exceed the groundwater protection standard at the waste boundary.

The Fate and Transport analysis was conducted for the operating time period of 55 years (“baseline”), which captures the amount of time elapsed from the 1980s, when CCR unit operations started, to 2034, which is the end of the projected active life of BABs.

The analysis considered different contaminant transport mechanisms including, advection, dispersion, and diffusion. The analysis indicates that advective flow would take more than a thousand years for a water molecule to travel from the bottom of BABs to upper most aquifer. Therefore, the analysis results indicate that, due to the low permeability nature of the in-situ unconsolidated materials, chemical diffusion is the dominant transport mechanism as opposed to advection or seepage velocity. Consequently, the current hydraulic conductivity testing described in Section 3 is sufficient to characterize hydraulic conductivity and demonstrate the performance of the alternate liner system as it relates to advection or seepage flow. It is highly unlikely that running the samples until they achieve termination criteria would change the outcome of this study, and therefore, the tests do not need to extend until March 2022.

The Fate and Transport analysis was augmented with a sensitivity analysis to account for sampling bias, uncertainty, and natural variation in site-specific inputs. Predicted groundwater concentrations for both the baseline and sensitivity analyses are below GWPS. The analysis results

show that there is no reasonable probability that water from BABs will cause releases to groundwater throughout its active life that will exceed the groundwater protection standard at the waste boundary over the projected active life of the CCR unit.

6. CERTIFICATION

**CCR Unit:** DTE Electric Company; Belle River Power Plant, Bottom Ash Basins (BABs)

I, Omer Bozok, being a Registered Professional Engineer in good standing in the State of Michigan, do hereby certify in accordance with the CCR Rule, to the best of my knowledge, information, and belief, that the information contained in this plan has been prepared in accordance with the accepted practice of engineering and that the BABs meets the requirements of the Alternative Liner Demonstration per the CCR Rule.

Omer Bozok

**Notes:**

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. Appendix IV GWPS is the higher of the MCL/RSL and UTL.

ug/L = micrograms per liter

mg/L = milligrams per liter

pCi/L = picocuries per liter

**Notes:**

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. Appendix IV GWPS is the higher of the MCL/RSL and UTL.

ug/L = micrograms per liter

mg/L = milligrams per liter

pCi/L = picocuries per liter

**Notes:**

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. Appendix IV GWPS is the higher of the MCL/RSL and UTL.

mg/L = milligrams per liter

pCi/L = picocuries per liter

**Notes:**

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. Appendix IV GWPS is the higher of the MCL/RSL and UTL.

mg/L = milligrams per liter

pCi/L = picocuries per liter

**Conversion:**

$$\frac{1 \text{ cm}}{1 \text{ sec}} \times \frac{86,400 \text{ sec}}{1 \text{ day}} \times \frac{1 \text{ ft}}{30.48 \text{ cm}} = 2.83\text{E}+03 \frac{\text{ft}}{\text{day}}$$

**Notes:**

Slug test results calculated using the Bower-Rice (1976) Solution.

MW-16-01 FALLING HEAD SLUG TEST

Data Set: P:\...\MW-16-01\_IN.aqt  
 Date: 05/22/17

Time: 13:38:07

PROJECT INFORMATION

Company: TRC Environmental Corporation  
 Client: DTE EC BRPP CCR  
 Project: 231828.0003.0000  
 Location: China Township, MI  
 Test Well: MW-16-01  
 Test Date: 4/13/16

AQUIFER DATA

Saturated Thickness: 52. ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16-01)

Initial Displacement: 0.835 ft  
 Total Well Penetration Depth: 84.12 ft  
 Casing Radius: 0.08333 ft

Static Water Column Height: 84.12 ft  
 Screen Length: 5. ft  
 Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined  
 K = 0.0003581 cm/sec

Solution Method: Bowser-Rice  
 y0 = 0.7491 ft

MW-16-01 RISING HEAD SLUG TEST

Data Set: P:\...\MW-16-01\_OUT.aqt

Date: 05/22/17

Time: 13:40:08

PROJECT INFORMATION

Company: TRC Environmental Corporation

Client: DTE EC BRPP CCR

Project: 231828.0003.0000

Location: China Township, MI

Test Well: MW-16-01

Test Date: 4/13/16

AQUIFER DATA

Saturated Thickness: 52. ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16-01)

Initial Displacement: 1.138 ft

Static Water Column Height: 84.07 ft

Total Well Penetration Depth: 84.07 ft

Screen Length: 5. ft

Casing Radius: 0.08333 ft

Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined

Solution Method: Bower-Rice

K = 0.0002716 cm/sec

y0 = 0.7541 ft

MW-16-04 FALLING HEAD SLUG TEST

Data Set: P:\...\MW-16-04\_IN.aqt  
 Date: 05/22/17

Time: 13:41:00

PROJECT INFORMATION

Company: TRC Environmental Corporation  
 Client: DTE EC BRPP CCR  
 Project: 231828.0003.0000  
 Location: China Township, MI  
 Test Well: MW-16-04  
 Test Date: 4/13/16

AQUIFER DATA

Saturated Thickness: 23.5 ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16-04)

Initial Displacement: 1.064 ft  
 Total Well Penetration Depth: 109.9 ft  
 Casing Radius: 0.08333 ft

Static Water Column Height: 109.9 ft  
 Screen Length: 5. ft  
 Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined  
 K = 7.93E-5 cm/sec

Solution Method: Bowser-Rice  
 y0 = 0.7646 ft

MW-16-04 RISING HEAD SLUG TEST

Data Set: P:\...\MW-16-04\_OUT.aqt  
 Date: 05/22/17

Time: 13:42:08

PROJECT INFORMATION

Company: TRC Environmental Corporation  
 Client: DTE EC BRPP CCR  
 Project: 231828.0003.0000  
 Location: China Township, MI  
 Test Well: MW-16-04  
 Test Date: 4/13/16

AQUIFER DATA

Saturated Thickness: 23.5 ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16-04)

Initial Displacement: 1.761 ft  
 Total Well Penetration Depth: 109.7 ft  
 Casing Radius: 0.08333 ft

Static Water Column Height: 109.7 ft  
 Screen Length: 5. ft  
 Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined  
 K = 4.108E-5 cm/sec

Solution Method: Bouwer-Rice  
 y0 = 0.7851 ft

### MW-16-05 FALLING HEAD SLUG TEST

Data Set: P:\...\MW-16-05\_IN.aqt  
 Date: 05/22/17

Time: 13:42:57

### PROJECT INFORMATION

Company: TRC Environmental Corporation  
 Client: DTE EC BRPP CCR  
 Project: 231828.0003  
 Location: China Township, MI  
 Test Well: MW-16-05  
 Test Date: 4/13/16

### AQUIFER DATA

Saturated Thickness: 7. ft

Anisotropy Ratio (Kz/Kr): 1.

### WELL DATA (MW-16-05)

Initial Displacement: 0.905 ft  
 Total Well Penetration Depth: 130.7 ft  
 Casing Radius: 0.08333 ft

Static Water Column Height: 130.7 ft  
 Screen Length: 5. ft  
 Well Radius: 0.08333 ft

### SOLUTION

Aquifer Model: Confined  
 K = 4.258E-5 cm/sec

Solution Method: Bower-Rice  
 y0 = 0.7426 ft

MW-16-05 RISING HEAD SLUG TEST

Data Set: P:\...\MW-16-05\_OUT.aqt

Date: 05/22/17

Time: 13:43:26

PROJECT INFORMATION

Client: DTE EC BRPP CCR

Project: 231828.0003.0000

Location: China Township, MI

Test Well: MW-16-05

Test Date: 4/13/16

AQUIFER DATA

Saturated Thickness: 7. ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16-05)

Initial Displacement: 1.668 ft

Static Water Column Height: 130.7 ft

Total Well Penetration Depth: 130.7 ft

Screen Length: 5. ft

Casing Radius: 0.08333 ft

Well Radius: 0.08333 ft

SOLUTION

Aquifer Model: Confined

Solution Method: Bower-Rice

K = 2.125E-5 cm/sec

y0 = 0.743 ft

### MW-16-07 FALLING HEAD SLUG TEST

Data Set: P:\...\MW-16-07\_IN.aqt  
Date: 05/22/17

Time: 13:44:03

### PROJECT INFORMATION

Company: TRC Environmental Corporation  
Client: DTE EC BRPP CCR  
Project: 231828.0003  
Location: China Township, MI  
Test Well: MW-16-07  
Test Date: 4/13/16

### AQUIFER DATA

Saturated Thickness: 2. ft

Anisotropy Ratio (Kz/Kr): 1.

### WELL DATA (MW-16-07)

Initial Displacement: 0.868 ft  
Total Well Penetration Depth: 124.9 ft  
Casing Radius: 0.08333 ft

Static Water Column Height: 124.9 ft  
Screen Length: 5. ft  
Well Radius: 0.08333 ft

### SOLUTION

Aquifer Model: Confined  
K = 0.0001236 cm/sec

Solution Method: Bouwer-Rice  
y0 = 0.7638 ft

MW-16-07 RISING HEAD SLUG TEST

Data Set: P:\...\MW-16-07\_OUT.aqt  
 Date: 05/22/17

Time: 13:44:45

PROJECT INFORMATION

Company: TRC Environmental Corporation  
 Client: DTE EC BRPP CCR  
 Project: 231828.0003.0000

K = Hydraulic Conductivity

NA = Not applicable

WC = water column height in well

A 5' long by 1" diameter slug was utilized to complete slug tests in these wells in September 2021.

DESCRIPTION

Cinders, fill  
Sandy topsoil  
Soft, brown & gray, silty Clay (CH)  
trace fine sand, high plasticity  
Stiff, brown, some fine sand

Very soft to soft, gray, silty Clay (CH-CL)

Firm, gray, sandy clay layer

Gray, silty Clay (CL) medium plasticity, 20% fine to coarse sand

Stiff, dark, gray clayey sand (SC)

Firm to stiff, gray, silty clay (CL), silt lenses  
Hard, some fine sand

Compact, gray, fine sand (SP)

silty fine sand (SM) 15% nonplastic fines

Compact, gray, very fine to coarse sand (SW)

Silty sand (SM) 15% nonplastic fines

Bottom of hole - Elevation - 451.4  
- Depth - 135.0 ft

This hole stopped at 135.0 ft. due to gas.

With casing at 110.0' no gas. Casing pulled to 57.0'. No gas. Pulled to 50.0', gas bubbling in hole. Capped hole and left for 48 hours. After 48 hours no gas (pocket only)

2-8-74 No gas  
2-11-74 Gas  
2-11-74 Pulled to 50.0', capped  
2-11-74 1400 hours removed cap (no gas)

82.5' - 107.0' used Gel to keep open

For Water Table Information consult Section 4.1.3.

PROJECT: BELLE RIVER PLANT UNITS I & II  
 TABLE: SUMMARY OF LABORATORY TEST RESULTS  
 FILE NO. 1255  
 DATE July 1974  
 SHEET OF

Silty CLAY, grey, soft consistency, moderately plastic (CL)  
 Sample includes about 15% fine to coarse Sand grains (subrounded to subangular in shape)  
 Note: Entire Sample disturbed.

SUBJECT: Soil Testing  
Hopper Investigation  
Belle River Coal Handling  
Detroit Edison Company  
Technical Specification, 10539-3-C-13  
REFERENCE: Purchase Order No. AA2184

Dear Sir:

Enclosed herewith is the summary of laboratory testing conducted on soil samples received from the subject site, as authorized by the referenced purchase order. The laboratory testing was performed in accordance with your technical specification 10539-3-C-13 and included the following tests:

|  | <u>Pages</u>     |
|--|------------------|
| 30 Visual Classification and In-Situ Moistures | B-1, B-2, B-9    |
| 10 Atterberg Limits                            | B-3, B-4, B-5    |
| 30 Unconfined Compression                      | B-6 through B-28 |
| 2 In-Situ Moisture and Density                 | B-6, B-8         |
| 5 Mechanical Analysis                          | B-29, B-30       |

We appreciate the opportunity of serving you and trust that this work has been performed to your satisfaction.

Very truly yours,

U. W. STOLL AND ASSOCIATES

**Notes:**

1. Method C, "Falling-Head, Increasing-Tailwater" test procedures were followed during the testing.
2. Specimen preparation: ST = Shelby Tube, R = Remolded, B = Block Sample.
3. Type of permeant liquid: DTW = Deaired Tap Water, DDW = Deaired Deionized (Distilled) Water

\* Deviations:

Laboratory temperature at 22±3 °C.

**Notes:**

1. Method C, "Falling-Head, Increasing-Tailwater" test procedures were followed during the testing.
2. Specimen preparation: ST = Shelby Tube, R = Remolded, B = Block Sample.
3. Type of permeant liquid: DTW = Deaired Tap Water, DDW = Deaired Deionized (Distilled) Water

# LAST PAGE

## **Test Applicability and Limitations:**

- The results are applicable only for the materials received at the laboratory and tested which may or may not be representative of the materials at the site.

## **Storage Policy:**

- Uncontaminated Material: All samples (or what is left) will be archived for a period of 3 months from the date received. Thereafter the samples will be discarded unless a written request for extended storage is received. A rate of \$1.00 per sample per day will be applied after the initial 3 month storage period.

- Contaminated Material: All samples (or what is left) will be archived for a period of 3 months from the date received. Thereafter, the samples will be returned to the project manager or his/her designated receiver unless a written request for extended storage is received. A rate of \$1.30 per sample per day will be applied after the initial 3 months storage.

Re: **DTE- Belle River (GLP-8017)**

Work Order: **20121752**

Dear Michael,

ALS Environmental received 3 samples on 18-Dec-2020 10:00 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental - Holland and for only the analyses requested.

Sample results are compliant with industry accepted practices and Quality Control results achieved laboratory specifications. Any exceptions are noted in the Case Narrative, or noted with qualifiers in the report or QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 21.

If you have any questions regarding this report, please feel free to contact me:

ADDRESS: 3352 128th Avenue, Holland, MI, USA  
PHONE: +1 (616) 399-6070 FAX: +1 (616) 399-6185

Sincerely,

A handwritten signature in black ink, appearing to read "Chad Whelton", is written over a light blue horizontal line.

Electronically approved by: Chad Whelton

Chad Whelton  
Project Manager

**Case Narrative**

Samples for the above noted Work Order were received on 12/18/2020. The attached "Sample Receipt Checklist" documents the status of custody seals, container integrity, preservation, and temperature compliance.

Samples were analyzed according to the analytical methodology previously transmitted in the "Work Order Acknowledgement". Methodologies are also documented in the "Analytical Result" section for each sample. Quality control results are listed in the "QC Report" section. Sample association for the reported quality control is located at the end of each batch summary. If applicable, results are appropriately qualified in the Analytical Result and QC Report sections. The "Qualifiers" section documents the various qualifiers, units, and acronyms utilized in reporting. A copy of the laboratory's scope of accreditation is available upon request.

With the following exceptions, all sample analyses achieved analytical criteria.

**Metals:**

No other deviations or anomalies were noted.

**Wet Chemistry:**

Batch R306912, Method SW9040C, Sample BAB-E (20121752-01B): pH is considered a "field test" and, as such, the recommended sample holding time expired prior to sample receipt.

Batch R306912, Method SW9040C, Sample BAB-W (20121752-02B): pH is considered a "field test" and, as such, the recommended sample holding time expired prior to sample receipt.

Batch R306912, Method SW9040C, Sample DB (20121752-03B): pH is considered a "field test" and, as such, the recommended sample holding time expired prior to sample receipt.

Batch R307145, Method SW9056A, Sample 20121752-03B MSD: The MSD recovery was outside of the control limit for Sulfate; however, the result in the parent sample is greater than 4x the spike amount. No qualification is required.

| <u>Qualifier</u> | <u>Description</u>  |
|------------------|---|
| *                | Value exceeds Regulatory Limit  |
| **               | Estimated Value   |
| a                | Analyte is non-accredited   |
| B                | Analyte detected in the associated Method Blank above the Reporting Limit   |
| E                | Value above quantitation range  |
| H                | Analyzed outside of Holding Time  |
| Hr               | BOD/CBOD - Sample was reset outside Hold Time, value should be considered estimated.  |
| J                | Analyte is present at an estimated concentration between the MDL and Report Limit   |
| ND               | Not Detected at the Reporting Limit   |
| O                | Sample amount is > 4 times amount spiked  |
| P                | Dual Column results percent difference > 40%  |
| R                | RPD above laboratory control limit  |
| S                | Spike Recovery outside laboratory control limits  |
| U                | Analyzed but not detected above the MDL   |
| X                | Analyte was detected in the Method Blank between the MDL and Reporting Limit, sample results may exhibit background or reagent contamination at the observed level. |

Re: ALS Workorder: 2012397  
Project Name: DTE - Belle River  
Project Number: GLP-8017

Dear Mr. Coram:

Three water samples were received from Geosyntec Consultants, on 12/18/2020. The samples were scheduled for the following analyses:

Radium-226

Radium-228

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental  
Julie Ellingson  
Project Manager

Accreditations: ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

40 CFR Part 136: All analyses for Clean Water Act samples are analyzed using the 40 CFR Part 136 specified method and include all the QC requirements.

## 2012397

### **Radium-228:**

The samples were analyzed for the presence of  $^{228}\text{Ra}$  by low background gas flow proportional counting of  $^{228}\text{Ac}$ , which is the ingrown progeny of  $^{228}\text{Ra}$ , according to the current revision of SOP 724.

All remaining acceptance criteria were met.

### **Radium-226:**

The samples were prepared and analyzed according to the current revision of SOP 783.

Sample 2012397-2 has a calculated yield as determined by ICP-AES above the 110% control limit at 132%. It is believed that there was native barium present in the sediment portion of the sample that was unaccounted for in the initial ICP aliquot. The result has been calculated conservatively, assuming a quantitative yield of 100%. This sample is identified with a "Y2" flag in the final reports, and the results are submitted without further qualification.

All remaining acceptance criteria were met.

**Percent Moisture:**

| Analyses | Result | Qual | Report Limit | Units | Dilution Factor | Date Analyzed |
|----------|--------|------|--------------|-------|-----------------|---------------|
|----------|--------|------|--------------|-------|-----------------|---------------|

**Explanation of Qualifiers**

**Radiochemistry:**

- "Report Limit" is the MDC
- U or ND - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- \* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
- G - Sample density differs by more than 15% of LCS density.
- D - DER is greater than Control Limit
- M - Requested MDC not met.
- M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.
- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

**Inorganics:**

- B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).
- U or ND - Indicates that the compound was analyzed for but not detected.
- E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.
- M - Duplicate injection precision was not met.
- N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.
- Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.
- \* - Duplicate analysis (relative percent difference) not within control limits.
- S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

**Organics:**

- U or ND - Indicates that the compound was analyzed for but not detected.
- B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.
- E - Analyte concentration exceeds the upper level of the calibration range.
- J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).
- A - A tentatively identified compound is a suspected aldol-condensation product.
- X - The analyte was diluted below an accurate quantitation level.
- \* - The spike recovery is equal to or outside the control criteria used.
- + - The relative percent difference (RPD) equals or exceeds the control criteria.
- G - A pattern resembling gasoline was detected in this sample.
- D - A pattern resembling diesel was detected in this sample.
- M - A pattern resembling motor oil was detected in this sample.
- C - A pattern resembling crude oil was detected in this sample.
- 4 - A pattern resembling JP-4 was detected in this sample.
- 5 - A pattern resembling JP-5 was detected in this sample.
- H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.
- L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.
- Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
  - gasoline
  - JP-8
  - diesel
  - mineral spirits
  - motor oil
  - Stoddard solvent
  - bunker C

## Technical Memorandum

---

**Date:** November 24, 2021

**To:** Chris Scieszka, DTE Electric Company

**From:** Vince Buening, TRC  
Sarah Holmstrom, TRC  
Kristin Lowery, TRC

**Project No.:** 413591.0003.0000 Phase 1 Task 1

**Subject:** Groundwater Protection Standard Calculation – DTE Electric Company, Belle River Power Plant Bottom Ash Basins

---

DTE Electric Company (DTE Electric) is pursuing an Alternate Liner Demonstration (ALD) for the Belle River Power Plant (BRPP) Bottom Ash Basins (BABs) coal combustion residual (CCR) unit. On November 12, 2020, the U.S. EPA published the Part B: Alternate Demonstration for Unlined Surface Impoundments amendments to the CCR Rule<sup>1</sup> (“Part B”) that allows a facility to prepare demonstration to request approval to operate an existing CCR surface impoundment with an alternate liner. Although the BRPP BABs remain in detection monitoring, per § 257.71(d)(1)(ii)(C)(2), the ALD must demonstrate that, for each Appendix IV constituent, there is no reasonable probability that the peak groundwater concentration that may result from releases that occur over the active life of the CCR surface impoundment will exceed the groundwater protection standard (GWPS) at the waste boundary.

GWPSs are set as either specific regulatory standards identified in the CCR Rule or background groundwater concentrations, whichever is higher, for the Appendix IV constituents. Per the CCR Rule §257.95(h)<sup>2</sup>, the EPA maximum contaminant levels (MCLs) will be the GWPSs for those constituents that have established MCLs. For Appendix IV constituents that do not have established MCLs, the GWPSs are based upon the EPA Regional Screening Levels (RSLs). For constituents that have statistically derived background levels higher than the MCL and/or RSL, the GWPS becomes equal to the background level.

This memorandum presents the background statistical limits and GWPS derived for the Appendix IV parameters for the BRPP BABs CCR unit using the aforementioned approach pursuant to §257.95(h). Per 40 CFR §257.94, a minimum of eight rounds of background sampling for the Appendix IV constituents were completed at the BRPP BABs from August 2016 through September 2017, as part of

---

<sup>1</sup> On April 17, 2015, the U.S. EPA issued the Final Rule: Disposal of CCR from Electric Utilities (CCR Rule), 40 CFR 257, Subpart D, to regulate the disposal of CCR materials generated at coal-fired units.

<sup>2</sup> As amended per Phase One, Part One of the CCR Rule (83 FR 36435).

## Technical Memorandum

initiating the detection monitoring program. Since fluoride is in both the Appendix III and Appendix IV constituent lists, additional fluoride data were collected under the detection monitoring program subsequent to September 2017 and were also used in the development of the GWPS. All of the Appendix IV data used in this analysis (August 2016 through December 2020) and details on how the data were collected are included in the annual reports prepared in accordance with the CCR Rule through January 2021.

The background data for the BRPP BABs were evaluated in accordance with the *Groundwater Statistical Evaluation Plan* (Stats Plan) (TRC, October 2017). Per the Stats Plan, the BRPP BABs CCR unit uses an intra-well statistical approach. For intra-well methods, the background data set is comprised of the historical data established at each individual monitoring well, which accounts for natural spatial variability that occurs in background encountered across the site. Background data were evaluated utilizing ChemStat™ statistical software. ChemStat™ is a software tool that is commercially available for performing statistical evaluation consistent with procedures outlined in U.S. EPA's *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (Unified Guidance; UG). Within the ChemStat™ statistical program (and the UG), tolerance limits were selected to perform the statistical calculation for background limits. Use of tolerance limits is a streamlined approach that offers adequate statistical power and is an acceptable approach under the CCR Rule. As such, upper tolerance limits (UTLs) were calculated for each of the CCR Appendix IV parameters, and, given that intra-well methods have been established for this site, a background UTL was calculated for each monitoring well and used to compare to the respective MCL or RSL. The following narrative describes the methods employed and the results obtained for the UTL calculations and the resulting GWPSs. The ChemStat™ output files are included as an attachment.

The set of background wells utilized for BRPP BABs includes MW-16-01, MW-16-02, MW-16-03, MW-16-04, and MW-16-09. The background data evaluation included the following steps:

- Review of data quality checklists for the baseline/background data sets for CCR Appendix IV constituents;
- Graphical representation of the baseline data as time versus concentration (T v. C) by well/constituent pair;
- Outlier testing of individual data points that appear from the graphical representations as potential outliers;
- Evaluation of percentage of nondetects for each baseline/background well-constituent (w/c) pair;
- Distribution of the data;
- Calculation of the UTLs for each cumulative baseline/background data set; and
- Establishment of GWPS as the higher of the MCL/RSL or the UTL for each Appendix IV constituent.

The results of these evaluations are presented and discussed below.

### Data Quality

Data from each sampling round were evaluated for completeness, overall quality and usability, method-specified sample holding times, precision and accuracy, and potential sample contamination. The review was completed using the following quality control (QC) information which at a minimum

## Technical Memorandum

included chain-of-custody forms, investigative sample results including blind field duplicates, and, as provided by the laboratory, method blanks, laboratory control spikes, laboratory duplicates. Data collected at MW-16-09 on 7/24/2017 were found to be anomalous due to high turbidity in the sample. Monitoring well MW-16-09 was resampled on 7/25/2017 with acceptable turbidity; therefore, the 7/24/2017 data was rejected and replaced with the 7/25/2017 data. The remaining data were found to be complete and usable for the purposes of the CCR monitoring program.

### Time versus Concentration Graphs

The time versus concentration (T v. C) graphs (Attachment A) do not show potential or suspect outliers for any of the Appendix IV parameters.

While variations in results are present, the graphs show consistent baseline data and do not suggest that data sets, as a whole, likely have overall trending or seasonality. However, due to limitations on CCR Rule implementation timelines, the data sets, with the exception of fluoride, are of relatively short duration for making such observations regarding overall trending or seasonality.

### Outlier Testing

No outliers were identified in the T v. C graphs. Therefore, outlier testing was not applicable.

As noted above, data collected at MW-16-09 on 7/24/2017 was found to be anomalous due to high turbidity in the sample. Therefore, these data were removed from the background data set and replaced with acceptable data from 7/25/2017. Outlier removal from the background data set is summarized in Table 1.

### Distribution of the Data Sets

ChemStat™ was utilized to evaluate each data set for normality. If the skewness coefficient was calculated to be between negative one and one, then the data were assumed to be approximately normally distributed. If the skewness coefficient was calculated as greater than one (or less than negative one) then the calculation was performed on the natural log (Ln) of the data. If the Ln of the data still determined that the data appeared to be skewed, then the Shapiro-Wilk test of normality (Shapiro-Wilk) was performed. The Shapiro-Wilk statistic was calculated on both non-transformed data and the Ln-transformed data. If the Shapiro-Wilk statistic indicated that normal distributional assumptions were not valid, then the parameter was considered a candidate for non-parametric statistical evaluation. The data distributions are summarized in Table 2.

### Tolerance Limits

Table 2 presents the calculated UTLs for the background/baseline data sets. As discussed above, the BRPP BABs CCR unit uses intra-well statistical methods; therefore, UTLs were calculated for each individual monitoring well. For normal and lognormal distributions, UTLs are calculated for 95 percent confidence using parametric methods. For non-normal background datasets, a nonparametric UTL is utilized, resulting in the highest value from the background dataset as the UTL. The achieved confidence levels for nonparametric tolerance limits depend entirely on the number of background data points, which are shown in the ChemStat™ outputs. The intra-well tolerance limits for each parameter were compared to the MCL/RSL and the higher value was established as the GWPS for that well.

## Technical Memorandum

### Groundwater Protection Standards

The resulting GWPSs were established as the higher of the MCL/RSL or the UTL for each Appendix IV constituent at each monitoring well. The GWPSs are summarized in Table 3.

**Notes:**

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. Appendix IV GWPS is the higher of the MCL/RSL and UTL.

ug/L = micrograms per liter

mg/L = milligrams per liter

pCi/L = picocuries per liter

|                              |   |
|------------------------------|---|
| 1. PURPOSE.....              | 3 |
| 2. ASSUMPTIONS.....          | 3 |
| 3. SOLUTION .....            | 3 |
| 4. TRAVEL TIME SOLUTION..... | 4 |

## 1. PURPOSE

The purpose of this calculation package is to calculate the vertical Darcy velocity of the model lithology for input in Fate and Transport numerical model at the Belle River Power Plant Bottom Ash Basins (BAB). Following Darcy velocity calculation, the solution is used to calculate the time of travel from the BABs to the Uppermost Aquifer.

## 2. ASSUMPTIONS

- Vertical flow is the dominant influence on contaminant transport; horizontal flow is not considered since a one-dimensional model was selected.
- Vertical hydraulic conductivity calculated in the laboratory using samples collected from borings is representative of subsurface conditions.

## 3. SOLUTION

The Darcy velocity ( $q$ ) through the model lithologies or layers is expressed in m/year =

$$= K(i) = K \left( \frac{H_1 - H_2}{l_1 - l_2} \right)$$

Where,

$K$  = vertical hydraulic conductivity (laboratory measured)

$i$  = vertical gradient

$H_1 - H_2$  = difference in hydraulic head between the BAB water level and the upper most aquifer potentiometric surface

$l_1 - l_2$  = distance in direction of flow

Thus:

$K$  = Geomean of Clay with Sand hydraulic conductivity value (data provided in Attachment 1) =  $2.15 \times 10^{-8}$  cm/s

$H_1$  = Total head at the bottom of BAB = 590 ft

$H_2$  = Average water level elevation from monitoring wells (data provided in Attachment 2) =  $574.28^1$  ft

$l_1$  = Bottom of ash pond = 580 ft

$l_2$  = Average elevation of well screen midpoints =  $470.98^1$  ft

$q$  = **Darcy velocity in m/year (= cm/s \* 315360) =  $1.02 \times 10^{-3}$  m/year**

<sup>1</sup> Value is an average taken from all monitoring wells

#### 4. TRAVEL TIME SOLUTION

Travel time ( $T$ ) through the model lithology is expressed in years =

$$T = t / \left( \frac{K * i}{n} \right)$$

Where:

$t$  = minimum model thickness

$K$  = vertical hydraulic conductivity (laboratory measured)

$i$  = vertical gradient

$n$  = effective porosity

Thus:

$t$  = Minimum model thickness per EVS model = 26.21 m

$K$  = Hydraulic conductivity =  $2.15 \times 10^{-8}$  cm/s

$i$  = Calculated using variables in Section 3 = 0.15

$n$  = Average of porosity data from Clay with Sand layer, converted to effective porosity using Sara (1994) = 0.34

$T$  = **Travel time in years (= s / 31536000) = 8,762 years**

**Note:** Time travel is not an input to Pollute model. It has been calculated to provide time estimate for the travel of water molecule from the bottom of BAB to top of uppermost aquifer.

|       | Clay with Sand | 1.02E-03                | 2.03E-03                                | 19.29         | 23.62             | 15.18             | 40        | 2.15E-08  | 0.019 | 0.02375   | 0.01425   | 0.34               | 0.45              | 0.20              | 0            | 1509.084            |

## Notes:

1. Kv = vertical hydraulic conductivity as determined by the analysis of field and laboratory data summarized in Table M-1
2. Analysis of vertical hydraulic conductivity includes data from long term tests updated on 8/20/2021
3. Kv of Clay with Sand selected for the calculation of the Darcy velocity as the higher and thus more conservative value of the two layers; POLLUTE only allows one input for Darcy velocity
4. CoHD = Coefficient of Hydrodynamic Dispersion
5. Effective Porosity determined by multiplying estimated porosity from field and lab data by 0.81, based on data provided by Sara, 1994

2ND EDITION

R. Kerry Rowe, Robert M. Quigley,  
Richard W.I. Brachman & John R. Booker

Figure 8.10 Chloride and potassium concentration versus depth in sample for model D (modified from Rowe et al., 1988).

variation in concentration with depth in the soil at the end of each test. The consistency of results demonstrates the power of the analytical model (program POLLUTE) and provides some con-

Figure 8.11 Chloride and potassium concentration versus depth in sample for model E (modified from Rowe et al., 1988).

fidence in the parameters  $D$  and  $\rho K_d$  for the clay and source fluids examined.

To provide an indication of parameter variation that might be expected for a given soil, a number of tests were duplicated. The diffusion coefficient,  $D$ , for chloride was deduced for each model and ranged between 0.018 and 0.02 m<sup>2</sup>/a with an average value of 0.019 m<sup>2</sup>/a. This small variation in  $D$  does not appear to be related to small differences in Darcy velocity, nor does it appear to be particularly related to the nature of the associated cation (see Table 8.3). Rather, the variability from 0.018 to 0.02 m<sup>2</sup>/a is seen as an indication of the level of repeatability that may be achieved for this type of test.

The application of an effective stress to the soil sample adopted in these tests is not an essential part of the proposed technique for determining the parameters  $D$  and  $K_d$ . Tests performed for the particular combination of clay and permeants considered herein gave similar results both with and without the application of the effective stress. However, for some combinations of clay and permeant, shrinkage of the clay may occur in the absence of a confining stress and this can give quite misleading results (e.g., see Quigley and Fernandez, 1989). For these clays, and for GCLs (see Chapter 12), tests should be performed at an effective stress similar to that anticipated in the field.

### 8.3.2 Pure diffusion tests

In many cases, it is not necessary to perform an advection-diffusion test. Under these circumstances, a simple diffusion test can be performed for boundary conditions shown in Figure 8.2. In this test, the soil sample is placed in a Plexiglass cylinder by trimming the sample to a size marginally greater than the specimen and then pressing the specimen into the cylinder, using a cutting shoe attached to the cylinder, to perform the final trim. This procedure is found to work well for many clays. However, it does not work well for clays with a significant stone content because the

## BAB\_ExtendedRun

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB Darcy

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00203$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

#### Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB CoHD High

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.02375 m <sup>2</sup> /a              | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.02375 m <sup>2</sup> /a              | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB CoHD Low

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.01425 m <sup>2</sup> /a              | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.01425 m <sup>2</sup> /a              | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB ClayPoro High

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.45            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB ClayPoro Low

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.27            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

#### Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB SandPoro High

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.45            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB SandPoro Low

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.20            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |
|-----------|-----------|--------------------|

## BAB ClayThick

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 13.99 m   | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 35                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |
|-----------|-----------|--------------------|

## BAB ClayThin

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 11.03 m   | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 19.29 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB SandThick

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 23.62 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |

## BAB SandThin

THE DARCY VELOCITY (Flux) THROUGH THE LAYERS  $V_a = 0.00102$  m/year

### Layer Properties

| Layer          | Thickness | Number of Sublayers | Coefficient of Hydrodynamic Dispersion | Matrix Porosity | Distribution Coefficient | Dry Density            |
|----------------|-----------|---------------------|--|-----------------|--------------------------|------------------------|
| Clay           | 12 m      | 25                  | 0.019 m <sup>2</sup> /a                | 0.37            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |
| Clay with Sand | 15.17 m   | 40                  | 0.019 m <sup>2</sup> /a                | 0.34            | 0 m <sup>3</sup> /kg     | 1510 kg/m <sup>3</sup> |

### Boundary Conditions

#### Constant Concentration

Source Concentration = 1 mg/L

#### Infinite Thickness Bottom Boundary

### Laplace Transform Parameters

TAU = 7   N = 20   SIG = 0   RNU = 2

### Calculated Concentrations at Selected Times and Depths

| Time year | Depth m   | Concentration mg/L |
