Executive Summary

On April 17, 2015, the United States Environmental Protection Agency (USEPA) published the final rule for the regulation and management of Coal Combustion Residuals (CCR) under the Resource Conservation and Recovery Act (RCRA) (the CCR Rule), as amended July 30, 2018. The CCR Rule, which became effective on October 19, 2015 (amendment effective August 29, 2018), applies to the DTE Electric Company (DTE Electric) River Rouge Power Plant (RRPP) Bottom Ash Basin (BAB) CCR unit. Pursuant to the CCR Rule, no later than January 31, 2018, and annually thereafter, the owner or operator of a CCR unit must prepare an annual groundwater monitoring and corrective action report for the CCR unit documenting the status of groundwater monitoring and corrective action for the preceding year in accordance with §257.90(e). On behalf of DTE Electric, TRC Engineers Michigan, Inc., the engineering entity of TRC Environmental Corporation (TRC), has prepared this Annual Report for calendar year 2018 activities at the RRPP BAB CCR unit.

DTE Electric proactively constructed and has been operating a groundwater collection system since March 2, 2018 to mitigate any potential risk of migration of any water from the BAB. We will continue to operate this groundwater collection system while we proceed with the prescribed steps per the CCR Rule to follow the assessment of corrective measures process described below.

In the January 31, 2018 *Annual Groundwater Monitoring Report for the River Rouge Power Plant*, covering calendar year 2017 activities, DTE Electric noted that boron, fluoride, and pH were observed within groundwater at one or more downgradient monitoring wells with statistically significant increases (SSIs) above background limits. Therefore, in April 2018, DTE Electric initiated an assessment monitoring program for the RRPP BAB CCR unit pursuant to §257.95 of the CCR Rule that included sampling and analyzing groundwater within the groundwater monitoring system for all constituents listed in Appendix IV.

The results from the initial assessment monitoring sampling event were used to establish groundwater protection standards (GWPSs) for the Appendix IV constituents in accordance with §257.95(h), as presented in the October 15, 2018 *Assessment Monitoring Data Summary and Statistical Evaluation*. The monitoring system was subsequently sampled for the Appendix III and Appendix IV constituents in May 2018, within 90 days from the initial Appendix IV sampling event, and in October 2018. Assessment monitoring data that has been collected and evaluated in 2018 are presented in this report.

Results were reported above GWPSs for arsenic and lithium in one or more downgradient wells during the initial assessment monitoring event for the groundwater samples collected in May 2018, and for arsenic in one downgradient well during the subsequent assessment monitoring event for the groundwater samples collected in October 2018. DTE Electric placed a notification

of the initial assessment monitoring event exceedance into the operating record on November 14, 2018 as required in §257.95(g) and within the timeframe required by §257.105(h)(8). Nature and extent groundwater sampling defined the extent of the potential release of CCR to be well within the radius of influence of the existing groundwater extraction system that has been in operation since March 2, 2018.

According to §257.95(g)(3), in the event that the facility determines, pursuant to §257.93(h), that a result is reported above GWPSs for one or more of the Appendix IV constituents, the facility will, within 90 days of performing the statistical analysis, initiate an assessment of corrective measures.

Although DTE Electric proceeded with initiating assessment of corrective measures per the CCR Rule by January 14, 2019, DTE Electric is proactively managing the potential migration pathway. DTE Electric's selected management strategy is to operate a groundwater extraction system to mitigate any risk of migration from the RRPP BAB to groundwater. This system was constructed during January and February 2018, began operation in early March 2018, is currently operational and is effectively capturing groundwater in the vicinity of the RRPP BAB.

Per §257.96(b) DTE Electric will continue semiannual assessment groundwater monitoring as specified in §257.95. The next assessment monitoring event is scheduled to be conducted in the second calendar quarter of 2019.

Section 1

Introduction

1.1 Program Summary

On April 17, 2015, the United States Environmental Protection Agency (USEPA) published the final rule for the regulation and management of Coal Combustion Residuals (CCR) under the Resource Conservation and Recovery Act (RCRA) (the CCR Rule), as amended July 30, 2018. The CCR Rule, which became effective on October 19, 2015 (amendment effective August 29, 2018), applies to the DTE Electric Company (DTE Electric) River Rouge Power Plant (RRPP) Bottom Ash Basin (BAB). Pursuant to the CCR Rule, no later than January 31, 2018, and annually thereafter, the owner or operator of a CCR unit must prepare an annual groundwater monitoring and corrective action report for the CCR unit documenting the status of groundwater monitoring and corrective action for the preceding year in accordance with §257.90(e). On behalf of DTE Electric, TRC Engineers Michigan, Inc., the engineering entity of TRC Environmental Corporation (TRC), has prepared this Annual Report for calendar year 2018 activities at the RRPP BAB CCR unit (2018 Annual Report).

In the January 31, 2018 *Annual Groundwater Monitoring Report for the River Rouge Power Plant*, covering calendar year 2017 activities (2017 Annual Report), DTE Electric noted that boron, fluoride, and pH were observed within groundwater at one or more downgradient monitoring wells with statistically significant increases (SSIs) above background limits. Therefore, DTE Electric initiated an assessment monitoring program for the RRPP BAB CCR unit pursuant to §257.95 of the CCR Rule that included sampling and analyzing groundwater within the groundwater monitoring system for all constituents listed in Appendix IV of the CCR Rule.

The results from the initial assessment monitoring sampling event were used to establish groundwater protection standards (GWPSs) for the Appendix IV constituents in accordance with §257.95(h), as presented in the October 15, 2018 *Assessment Monitoring Data Summary and Statistical Evaluation*. The monitoring system was subsequently sampled for the Appendix III and Appendix IV constituents in May 2018 within 90 days from the initial Appendix IV sampling event, and in October 2018. Assessment monitoring data that has been collected and evaluated in 2018 are presented in this report.

Given the uncertainty around the potential hydraulic connection between the RRPP BAB CCR unit and the uppermost aquifer, the detected arsenic concentrations above the generic Michigan Part 201 drinking water and groundwater surface water interface criteria within the groundwater in the uppermost aquifer around the RRPP BAB CCR unit during background sampling, and the proximity of the RRPP BAB to the Rouge River, DTE Electric is proactively

managing this potential migration pathway. DTE Electric’s selected management strategy is to operate a groundwater extraction system as a presumptive remedy to mitigate any risk of migration from the RRPP BAB to groundwater. This groundwater extraction system was constructed during January and February 2018, began operation in early March 2018, and is currently operational and effectively capturing groundwater in the vicinity of the RRPP BAB.

This 2018 Annual Report presents the monitoring results and the statistical evaluation of the assessment monitoring parameters (Appendix IV to Part 257 of the CCR Rule) for the April, May and October 2018 assessment groundwater monitoring events for the RRPP BAB CCR unit. Assessment monitoring for these events was performed in accordance with the *CCR Groundwater Monitoring and Quality Assurance Project Plan – DTE Electric Company River Rouge Power Plant Bottom Ash Basin* (the QAPP) (TRC, July 2016; revised August 2017) and statistically evaluated per the *Groundwater Statistical Evaluation Plan – DTE Electric Company River Rouge Power Plant Coal Combustion Residual Bottom Ash Basin* (Stats Plan) (TRC, October 2017). As part of the statistical evaluation, the data collected during assessment monitoring events are evaluated to identify SSIs of assessment monitoring parameters compared to background levels. In addition, nature and extent groundwater sampling data from existing monitoring wells around the BAB that was performed in October 2018 are presented.

1.2 Site Overview

The RRPP BAB is located at 1 Belanger Park Drive, within the City of River Rouge in Wayne County, Michigan. The RRPP, including the BAB CCR unit, was originally constructed in the early 1950s, just northeast of the DTE Electric RRPP. The power plant property is located at the confluence of the Rouge River and the Detroit River.

The RRPP BAB is a sedimentation basin that is an incised CCR surface impoundment. The impoundment is sheet-piled around the perimeters to approximately 30 feet below ground surface (ft bgs) into the native soil. The BAB is used for receiving sluiced bottom ash and other process flow effluent pumped from the power plant to the eastern end of the BAB. There is a sheet pile weir near the middle of the BAB that maintains the water elevation in the eastern portion to approximately 577.5 feet through gravity flow. The water in the western portion of the BAB is maintained at an elevation of no higher than 577 feet before being recirculated back to the RRPP and/or is discharged into the Detroit River in accordance with a National Pollution Discharge Elimination System (NPDES) permit.

1.3 Geology/Hydrogeology

The RRPP BAB CCR unit is located immediately adjacent to the Rouge River to the northeast near the intersection of the Rouge River and Detroit River (Figure 1). The RRPP CCR unit is underlain initially by approximately 10 feet of surficial fill of various composition (gravel, sand,

silt and clay, brick and/or concrete fragments). The fill is partially saturated in some areas, but is not continuously saturated across the RRPP, does not represent a significant, usable source of water, and is, therefore, not an aquifer. An organic layer is often encountered beneath the surficial fill that is then underlain by a silt/clay-rich unit that ranges from 3 to about 8 feet thick in the area of the BAB. Beneath the silt/clay-rich unit, there is a saturated sand and gravel unit that often coarsens from sand to gravel with depth. This coarse-grained sand and gravel unit is present from as shallow as 15 ft bgs to as deep as 25.5 ft bgs. This same coarse-grained unit is observed in most of the historical boring logs across the RRPP and appears to be a relatively continuous unit across the RRPP. Based on this information, this coarse-grained sand and gravel unit represents the uppermost aquifer present at the RRPP BAB CCR unit.

The coarse-grained sand and gravel uppermost aquifer is underlain by a more than 60-foot-thick contiguous silty clay-rich deposit that serves as a natural lower confining hydraulic barrier that isolates the uppermost aquifer from the underlying Dundee limestone that represents the next aquifer. There is no apparent hydraulic connection between the uppermost aquifer and the Dundee limestone aquifer, and the limestone aquifer is artesian.

Historically, a definitive groundwater flow direction to the northeast with an average gradient of 0.00067 foot/foot (using data from June 2016 through September 2017) within the uppermost aquifer is evident around the RRPP BAB CCR unit, with potential groundwater flow rates within the uppermost aquifer ranging from approximately 5.8 to 73 feet/year. Due to the installation and continuous operation of the eleven extraction wells within the groundwater extraction system since March 2, 2018, the current groundwater flow regime is significantly different from previous monitoring events. The series of eleven groundwater extraction wells surrounding the basin creates an inward gradient that extends to the edge of the Rouge River. The radius of influence extends beyond all CCR monitoring wells, with the exception of the upgradient monitoring well MW-17-07 that is a background well located more than 1,500 feet up hydraulic gradient of the RRPP BAB CCR unit. Additionally, there is an eastern groundwater flow component on the southeast edge of the site toward the Detroit River (from MW-17-07 to the Detroit River). The groundwater extraction system well layout is shown on Figure 2 and soil boring logs and well construction diagrams are provided in Appendix A.

Section 2

Groundwater Monitoring

2.1 Monitoring Well Network

A groundwater monitoring system has been established for the RRPP BAB CCR unit as detailed in the *Groundwater Monitoring System Summary Report – DTE Electric Company River Rouge Power Plant Bottom Ash Basin Coal Combustion Residual Unit* (GWMS Report) (TRC, October 2017). The monitoring well network for the BAB CCR unit currently consists of five monitoring wells that are screened in the uppermost aquifer. The monitoring well locations are shown on Figure 2. Monitoring wells MW-17-06 and MW-17-07 are located south-southwest of the RRPP BAB and provide data on background groundwater quality that has not been affected by the CCR unit (total of two background wells). Monitoring wells MW-16-01 through MW-16-03 are located north-northeast, downgradient of the RRPP BAB CCR unit (total of three downgradient monitoring wells).

As shown on Figure 2, monitoring well MW-16-04S is used for water level measurements only. MW-16-04S had originally been installed as a potential background monitoring well; however, based on concentrations of several Appendix III parameters, the proximity of the well to the BAB and the hydrogeology of the area, monitoring well MW-16-04S does not appear to be representative of background groundwater conditions; therefore, this well was excluded from the background monitoring network. As such, in June 2017, two additional monitoring wells (MW-17-06 and MW-17-07) were installed in the uppermost aquifer further upgradient on the southwest side of the RRPP main building for use as background wells (Figure 2).

In addition, eleven groundwater recovery wells were installed as part of a groundwater extraction system (Figure 2, Appendix A) and additional monitoring wells were added to evaluate the groundwater extraction system groundwater capture (Figure 5, Appendix A). Although the groundwater extraction system has changed groundwater flow significantly in the RRPP BAB CCR unit, the three downgradient monitoring wells (MW-16-01 through MW-16-03) are appropriately positioned to evaluate groundwater quality in the vicinity of the RRPP BAB CCR unit. However, while the groundwater extraction system is operational, inward hydraulic gradients are maintained toward the extraction wells and the RRPP BAB CCR unit, and the monitoring wells (MW-16-01 through MW-16-03) are not immediately downgradient from the RRPP BAB CCR unit, rather they are on the upgradient edge of the groundwater capture zone on the downgradient side of the RRPP BAB CCR unit adjacent to the Rouge River (Figures 3 through 5).

2.2 Preliminary Assessment Monitoring

DTE Electric reported in the 2018 Annual Report that boron, fluoride, and pH were observed within groundwater in one or more downgradient monitoring well(s) with SSIs above background concentration levels. Therefore, DTE Electric initiated an Assessment Monitoring Program for the RRPP BAB CCR unit pursuant to §257.95 of the CCR Rule that included sampling and analyzing groundwater within the groundwater monitoring system for all constituents listed in Appendix IV. The monitoring was performed in accordance with the QAPP.

2.2.1 Data Summary

The preliminary Appendix IV only assessment monitoring event (per §257.95(b)) was performed on April 6, 2018. Downgradient monitoring wells MW-16-01 through MW-16-03 and background monitoring wells MW-17-06 and MW-17-07 were sampled during this event.

Static water elevation measurements were collected from all the CCR groundwater monitoring system monitoring well locations, in addition to surface water measuring points MP-01 through MP-04 established along the Rouge River and Detroit River (Figure 2). Static water elevation data are summarized in Table 1 and groundwater elevation data are shown on Figure 3. Monitoring wells were purged with peristaltic or dedicated submersible pumps utilizing low-flow sampling methodology. Field parameters were stabilized at each monitoring well prior to collecting groundwater samples in accordance with the QAPP. Field parameters are summarized in Table 2.

The groundwater samples were analyzed by TestAmerica Laboratories (TestAmerica) for Appendix IV parameters during the preliminary assessment monitoring event in accordance with the QAPP. The analytical results for each event are summarized in Table 3.

2.2.2 Data Quality Review

Data from the preliminary Appendix IV only assessment monitoring event were evaluated for completeness, overall quality and usability, method-specified sample holding times, precision and accuracy, and potential sample contamination. The data were found to be complete and usable for the purposes of the CCR monitoring program. Data quality reviews are summarized in Appendix B.

2.2.3 Groundwater Flow Rate and Direction

Groundwater elevation data collected during the preliminary event shows that groundwater within the uppermost aquifer in the vicinity of the RRPP BAB is being

captured by the recently installed groundwater extraction well system. The series of eleven extraction wells surrounding the basin creates an inward gradient that extends to the edge of the river. The radius of influence extends beyond all CCR monitoring wells with the exception of MW-17-07. Additionally, there is an eastern groundwater flow component on the southeast edge of the site toward the Detroit River (from MW-17-07 to the Detroit River). Groundwater elevations measured across the Site during the April 2018 sampling event are provided on Table 1 and were used to construct the groundwater contour map provided in Figure 3.

The figure shows that, due to the installation of the groundwater extraction system, the current groundwater flow is significantly different from previous monitoring events. The average hydraulic gradient throughout the RRPP BAB CCR unit during the April 2018 event is estimated at 0.008 ft/ft (significantly greater than the average hydraulic gradient prior to the groundwater extraction system beginning operation). The gradient was calculated using the following well pairs: MW-17-06/MW-16-04S and MW-17-07/MW-17-06. Using the low hydraulic conductivity of 9.5 feet/day and high hydraulic conductivity of 120 feet/day presented in the GWMS Report, and an assumed effective porosity of 0.4, the estimated seepage velocity ranges from approximately 0.2 feet/day (approximately 70 feet/year) to approximately 2.5 feet/day (approximately 910 feet/year) for the April 2018 event.

2.3 Semiannual Assessment Groundwater Monitoring

Per §257.95(d), within 90 days of the preliminary assessment monitoring event and semiannually thereafter, all wells must be resampled and analyzed for the indicator parameters from Appendix III and detected Appendix IV parameters of the CCR Rule. In addition to the Appendix III and IV indicator parameters, field parameters including pH, dissolved oxygen, oxidation reduction potential, specific conductivity, temperature, and turbidity were collected at each well. Samples were collected and analyzed in accordance with the QAPP.

2.3.1 Data Summary

The first semiannual groundwater assessment monitoring event for 2018 was performed during May 30 and 31, 2018 by TRC personnel and samples were analyzed by TestAmerica in accordance with the QAPP. Static water elevation data were collected at all monitoring well locations in addition to surface water measuring points MP-01 through MP-04 established along the Rouge River and Detroit River (Figure 2).

Groundwater samples were collected from the two background monitoring wells and three downgradient monitoring wells for the Appendix III and detected Appendix IV indicator parameters and field parameters. A summary of the groundwater data

collected during the May 2018 event is provided on Table 1 (static groundwater elevation data), Table 2 (field data), and Table 3 (analytical results).

The second semiannual groundwater assessment monitoring event for 2018 was performed on October 15 and 16, 2018 by TRC personnel and samples were analyzed by TestAmerica in accordance with the QAPP. Static water elevation data were collected at all the CCR groundwater monitoring system monitoring well locations in addition to surface water measuring points MP-01 through MP-04 established along the Rouge River and Detroit River (Figure 2). Groundwater samples were collected from the two background monitoring wells and three downgradient monitoring wells for the Appendix III and detected Appendix IV indicator parameters and field parameters. A summary of the groundwater data collected during the October 2018 event is provided on Table 1 (static groundwater elevation data), Table 2 (field data), and Table 3 (analytical results).

2.3.2 Data Quality Review

Data from each round were evaluated for completeness, overall quality and usability, method-specified sample holding times, precision and accuracy, and potential sample contamination. The data were found to be complete and usable for the purposes of the CCR monitoring program. Data quality reviews are summarized in Appendix B.

2.3.3 Groundwater Flow Rate and Direction

Groundwater elevation data collected during the May and October 2018 sampling events show that groundwater within the uppermost aquifer in the vicinity of the RRPP BAB is being captured by the recently installed groundwater extraction well system. Similar to the April 2018 event, the series of eleven extraction wells surrounding the basin creates an inward gradient that extends to the edge of the river. The radius of influence extends beyond all CCR monitoring wells with the exception of MW-17-07 that is a background well located more than 1,500 feet up hydraulic gradient of the RRPP BAB CCR unit. Additionally, there is an eastern groundwater flow component on the southeast edge of the site toward the Detroit River (from MW-17-07 to the Detroit River). Groundwater elevations measured across the Site during the May and October 2018 sampling events are provided on Table 1 and were used to construct groundwater contour maps (Figures 4 and 5, respectively).

The figures show that, due to the installation of the groundwater extraction system, the current groundwater flow is significantly different from previous monitoring events before the groundwater extraction system was operational. The average hydraulic gradients throughout the RRPP BAB CCR unit during the May and October 2018 events

were very consistent with the April 2018 event, and show a hydraulic gradient of approximately 0.008 ft/ft is being maintained (significantly greater than the average hydraulic gradient prior to the groundwater extraction system beginning operation). The gradients were calculated using the same well pairs as above (MW-17-06/MW-16-04S and MW-17-07/MW-17-06). Using the aforementioned low hydraulic conductivity of 9.5 feet/day and high hydraulic conductivity of 120 feet/day, and an assumed effective porosity of 0.4, the estimated seepage velocity ranges from approximately 0.2 feet/day (approximately 70 feet/year) to approximately 2.5 feet/day (approximately 920 feet/year) for the May and October 2018 events as it did in April 2018.

Section 3

Statistical Evaluation

3.1 Establishing Groundwater Protection Standards

In accordance with §257.95(h) and the Stats Plan, groundwater protection standards (GWPSs) were established for the Appendix IV indicator parameters following the preliminary assessment monitoring event using nine rounds of data collected from the background monitoring wells MW-17-06 and MW-17-07 (July 2017 through April 2018). The calculation of the GWPSs is documented in the *Assessment Monitoring Data Summary and Statistical Evaluation* (Initial Assessment Monitoring Statistical Evaluation Memo) (TRC, October 2018a). The GWPS is established as the higher of the USEPA Maximum Contaminant Level (MCL) or statistically derived background level for constituents with MCLs and the higher of the USEPA Regional Screening Levels (RSLs) or background level for constituents with RSLs. The Appendix IV GWPSs will be used to determine whether groundwater has been impacted from the RRPP BAB CCR unit by statistically comparing concentrations in the assessment monitoring wells to their respective GWPS for each Appendix IV indicator parameter.

3.2 Initial Assessment Monitoring Statistical Evaluation (May 2018)

Following the initial and subsequent assessment monitoring sampling events (April and May 2018), the compliance well groundwater concentrations for Appendix IV parameters were compared to the GWPSs to determine if a statistically significant exceedance had occurred in accordance with §257.93. Consistent with the *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, Unified Guidance* (Unified Guidance) (USEPA, 2009), the preferred method for comparisons to a fixed standard are confidence limits. An exceedance of the standard occurs when the 99 percent lower confidence level of the downgradient data exceeds the GWPS. Confidence intervals were established per the statistical methods detailed in the *Assessment Monitoring Statistical Evaluation* technical memorandum for the May 2018 assessment monitoring event provided in Appendix C (TRC, October 2018b).

For each detected constituent, the concentrations for each well were first compared directly to the GWPS. Parameter-well combinations that included a direct exceedance of the GWPS were retained for further statistical analysis using confidence limits as detailed in the Appendix C technical memorandum. The calculated upper and lower confidence limits and comparison of the lower confidence limits to the GWPSs are provided in Table 4 for the May 2018 event.

The statistical evaluation of the May 2018 Appendix IV indicator parameters shows statistical exceedances of the GWPSs for:

- Arsenic at MW-16-01; and
- Lithium at MW-16-01 and MW-16-02.

There were no exceedances compared to background for the remaining Appendix IV indicator parameters during the initial May 2018 assessment monitoring event.

Results from the initial assessment monitoring event for arsenic and lithium were above GWPSs. DTE Electric placed a notification of the statistical exceedances into the operating record on November 14, 2018 as required in §257.95(g) and within the timeframe required by §257.105(h)(8). In addition, as required in §257.95(g)(1), nature and extent groundwater sampling was conducted as detailed in Section 4 of this report.

3.3 Data Comparison to Background Limits – Second Semiannual Event (October 2018)

Given the timing of the GWPS calculations by October 15, 2018 (TRC, October 2018a) and the semiannual sampling schedule, the second semiannual sampling event was performed in October 2018, concurrent with the initial assessment monitoring statistical evaluation and subsequent next steps related to the initial exceedances of the GWPSs. Statistical analysis for the second semiannual monitoring event was performed using the same approach as the initial assessment monitoring statistical evaluation as discussed in the *October 2018 Appendix IV Assessment Monitoring Statistical Evaluation* technical memorandum provided in Appendix D (TRC, January 2019). The calculated upper and lower confidence limits and comparison of the lower confidence limits to the GWPSs for the October 2018 event are provided in Table 5.

The statistical evaluation of the October 2018 Appendix IV indicator parameters shows continued results above GWPSs for:

- Arsenic at MW-16-01

There were no other results reported above GWPSs for the remaining Appendix IV indicator parameters.

Section 4

Nature and Extent Groundwater Evaluation

4.1 Nature and Extent Groundwater Sampling

Per §257.95(g)(1), in the event that the facility determines, pursuant to §257.93(h), that there is a statistical exceedance of the GWPSs for one or more of the Appendix IV constituents, the facility must characterize the nature and extent of the release of CCR as well as any site conditions that may affect the remedy selected. As such, nature and extent groundwater sampling was completed on October 15 and 16, 2018, by TRC personnel from monitoring wells previously installed in conjunction with the installation of the presumptive remedy and/or other existing site monitoring wells. The soil boring logs and well construction diagrams for the additional monitoring wells utilized for the nature and extent groundwater sampling are included in Appendix A.

Groundwater elevation data were collected at all site monitoring wells shown on Figure 5. Groundwater samples were collected at monitoring wells MW-16-04s, MW-17-05, MW-17-13 through MW-17-15, MW-17-18, and MW-17-20. Field parameters were stabilized at each monitoring well prior to collecting groundwater samples. Field parameters are summarized in Table 2. Groundwater samples were analyzed by TestAmerica for the Appendix III and detected Appendix IV parameters. A summary of the analytical groundwater data collected during the October 2018 nature and extent sampling event is provided on Table 6.

Concentrations of arsenic and lithium above the GWPSs were observed in monitoring wells MW-17-14 and MW-17-15. These monitoring wells are located within the radius of influence of the groundwater extraction system as shown on Figure 5. Concentrations of the Appendix IV indicator parameters were below the GWPSs in other wells located farther away from the RRPP BAB CCR unit (e.g., MW-16-04S, MW-17-05, MW-17-13, MW-17-18 and MW-17-20), delineating the extent of the potential CCR groundwater release to be within the capture zone of the groundwater extraction system that has been operational since March 2, 2018. Therefore, as long as the groundwater extraction system is in operation there is no potential for affected groundwater to migrate off site. In addition, all the land that overlies the potentially affected groundwater is owned by DTE Electric.

Section 5

Conclusions and Recommendations

Results above GWPSs were reported for arsenic and lithium in one or more downgradient wells during the initial assessment monitoring event for the groundwater samples collected in May 2018 and for arsenic in one downgradient well during the subsequent assessment monitoring event for the groundwater samples collected in October 2018. DTE Electric placed a notification of the initial assessment monitoring event into the operating record on November 14, 2018 as required in §257.95(g) and within the timeframe required by §257.105(h)(8). Nature and extent groundwater sampling defined the extent of the potential release of CCR to be well within the radius of influence of the existing groundwater extraction system that has been in operation since March 2, 2018.

According to §257.95(g)(3), in the event that the facility determines, pursuant to §257.93(h), that there is a SSI above the GWPSs for one or more of the Appendix IV constituents, the facility will, within 90 days of performing the statistical analysis, initiate an assessment of corrective measures. Per §257.96(b) DTE Electric will continue semiannual assessment groundwater monitoring as specified in §257.95. The next assessment monitoring event is scheduled to be conducted in the second calendar quarter of 2019.

Although DTE Electric proceeded with initiating assessment of corrective measures per §257.96 by January 14, 2019, DTE Electric is currently operating a presumptive remedy groundwater extraction system to maintain hydraulic control around the RRPP BAB to mitigate any risk of migration from the RRPP BAB to groundwater. This system effectively captures groundwater in the vicinity of the RRPP BAB CCR unit and eliminates the potential for Appendix III and Appendix IV parameters to migrate off-site from the RRPP BAB CCR unit.

Section 6

Groundwater Monitoring Report Certification

The U.S. EPA's Disposal of Coal Combustion Residuals from Electric Utilities Final Rule Title 40 CFR Part 257 §257.90(e) requires that the owner or operator of an existing CCR unit prepare an annual groundwater monitoring and corrective action report.

Annual Groundwater Monitoring Report Certification River Rouge Power Plant Bottom Ash Basin River Rouge, Michigan

CERTIFICATION

I hereby certify that the annual groundwater and corrective action report presented within this document for the RRPP BAB CCR unit has been prepared to meet the requirements of Title 40 CFR §257.90(e) of the Federal CCR Rule. This document is accurate and has been prepared in accordance with good engineering practices, including the consideration of applicable industry standards, and with the requirements of Title 40 CFR §257.90(e).

Name: David B. McKenzie, P.E.	Expiration Date: October 31, 2019	 <p style="text-align: center;">Stamp</p>
Company: TRC Engineers Michigan, Inc.	Date: <i>January 31, 2019</i>

Notes:

ug/L - micrograms per liter.

mg/L - milligrams per liter.

SU - standard units; pH is a field parameter.

pCi/L - picocuries per liter.

NA - not applicable.

NC - no criteria.

-- - not analyzed.

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April, 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. GWPS is the higher of the MCL/RSL and UTL.

* - Secondary Maximum Contaminant Level (SMCL), EPA Secondary Drinking Water Regulations

(SDWR) April, 2012.

Bold value indicates an exceedance of the GWPS. Data from downgradient monitoring wells are screened against the GWPS for evaluation purposes only. Confidence intervals will be used to determine compliance per the CCR rules

Table 4
 Summary of Groundwater Protection Standard Exceedances – May 2018
 River Rouge Power Plant Bottom Ash Basin – RCRA CCR Monitoring Program
 River Rouge, Michigan

Appendix IV	Units	GWPS	MW-16-01		MW-16-02		MW-16-03	
			LCL	UCL	LCL	UCL	LCL	UCL
Arsenic	ug/L	32	35	170	NA	NA	4.0	17
Lithium	ug/L	40	47	52	41	70	11	51

Notes:

ug/L - micrograms per liter.

NA - not applicable.

GWPS - Groundwater Protection Standard.

UCL - Upper Confidence Limit (99%) of the downgradient data set.

LCL - Lower Confidence Limit (99%) of the downgradient data set.

Indicates a statistically significant exceedance of the GWPS. An exceedance occurs when the LCL exceeds the GWPS.

Table 5
 Summary of Groundwater Protection Standard Exceedances – October 2018
 River Rouge Power Plant Bottom Ash Basin – RCRA CCR Monitoring Program
 River Rouge, Michigan

Appendix IV	Units	GWPS	MW-16-01		MW-16-02		MW-16-03	
			LCL	UCL	LCL	UCL	LCL	UCL
Arsenic	ug/L	32	36	170	NA	NA	NA	NA
Lithium	ug/L	40	37	65	9.7	66	-19	54

Notes:

ug/L - micrograms per liter.

NA - not applicable.

GWPS - Groundwater Protection Standard.

UCL - Upper Confidence Limit (99%) of the downgradient data set.

LCL - Lower Confidence Limit (99%) of the downgradient data set.

Indicates a statistically significant exceedance of the GWPS. An exceedance occurs when the LCL exceeds the GWPS.

Notes:

ug/L - micrograms per liter.

mg/L - milligrams per liter.

SU - standard units; pH is a field parameter.

pCi/L - picocuries per liter.

NA - not applicable.

NC - no criteria.

-- - not analyzed.

MCL - Maximum Contaminant Level, EPA Drinking Water Standards and Health Advisories, April, 2012.

RSL - Regional Screening Level from 83 FR 36435.

UTL - Upper Tolerance Limit (95%) of the background data set.

GWPS - Groundwater Protection Standard. GWPS is the higher of the MCL/RSL and UTL.

* - Secondary Maximum Contaminant Level (SMCL), EPA Secondary Drinking Water Regulations (SDWR) April, 2012.

Bold value indicates an exceedance of the GWPS. Data from downgradient monitoring wells are screened against the GWPS for evaluation purposes only. Confidence intervals will be used to determine compliance per the CCR rules.

Data Quality Reviews

Laboratory Data Quality Review

Groundwater Monitoring Event April 2018

DTE Electric Company River Rouge Power Plant (DTE RRPP)

Groundwater samples were collected by TRC for the April 2018 sampling event for the Bottom Ash Basin at the DTE RRPP. Samples were analyzed for anions and total metals by Test America Laboratories, Inc. (Test America) located in Canton, Ohio and radium by Test America located in St. Louis, Missouri. The laboratory analytical results are reported in laboratory report J93851-1.

During the April 2018 sampling event, a groundwater sample was collected from each of the following wells:

- MW-16-01
- MW-16-02
- MW-16-03
- MW-17-06
- MW-17-07

In addition, a groundwater sample was collected in non-compliance monitoring well MW-16-04S which was submitted for analysis along with the compliance well samples and are included for quality review purposes.

Each sample was analyzed for the following constituents:

Analyte Group	Method
Anions (Fluoride)	EPA 9056A
Total Metals	EPA 6020, EPA 7470A
Radium (Radium-226, Radium-228, Total Radium)	SW846 9315, SW846 9320

TRC reviewed the laboratory data to assess data usability. The following sections summarize the data review procedure and the results of the review.

Data Quality Review Procedure

The analytical data were reviewed using the USEPA National Functional Guidelines for Inorganic Superfund Data Review (USEPA, 2017) and the Department of Energy Evaluation of Radiochemical Data Usability (USDOE, 1997). The following items were included in the evaluation of the data:

- Sample receipt, as noted in the cover page or case narrative;
- Technical holding times for analyses;
- Reporting limits (RLs) compared to project-required RLs;
- Data for method blanks. Method blanks are used to assess potential contamination arising from laboratory sample preparation and/or analytical procedures;

- Data for laboratory control samples (LCSs) and laboratory control sample duplicates (LCSDs). The LCS/LCSDs are used to assess the accuracy of the analytical method using a clean matrix;
- Percent recoveries for matrix spike (MS) and matrix spike duplicates (MSD). Percent recoveries are calculated for each analyte spiked and used to assess bias due to sample matrix effects;
- Data for blind field duplicates. Field duplicate samples are used to assess variability introduced by the sampling and analytical processes;
- Percent recoveries for the carriers for radium-226 and radium-228 analyses; and
- Overall usability of the data.

This data usability report addresses the following items:

- Usability of the data if quality control (QC) results suggest potential problems with all or some of the data;
- Actions regarding specific QC criteria exceedances.

Review Summary

The data quality objectives and laboratory completeness goals for the project were met, and the data are usable for their intended purpose. A summary of the data quality review, including non-conformances and issues identified in this evaluation are noted below.

- Appendix IV constituents will be utilized for the purposes of an assessment monitoring program.
- Data are usable for the purposes of the assessment monitoring program.
- When the data are evaluated through an assessment monitoring statistical program, findings below may be used to support the removal of outliers.

QA/QC Sample Summary:

- No target analytes were detected in the method blank.
- The percent recoveries for the carriers for radium-226 and radium-228 analyses were within QC limits.
- LCS/LCSD recoveries and RPDs were within laboratory control limits.
- MS/MSD analyses were performed on sample MW-16-01 for metals and on sample MW-16-03 for fluoride. The recovery of calcium in the MS was above QC limit for batch 322404. The calcium concentration in the parent sample (MW-16-01) was >4x the spike concentration; therefore, the laboratory control limits are not applicable and data usability was not affected.
- The field duplicate pair samples were Dup-01 and MW-16-04S. The relative percent differences (RPDs) between the parent and duplicate sample were within QC limits.

Laboratory Data Quality Review

Groundwater Monitoring Event May 2018

DTE Electric Company River Rouge Power Plant (DTE RRPP)

Groundwater samples were collected by TRC for the May 2018 sampling event for the Bottom Ash Basin at the DTE RRPP. Samples were analyzed for anions, total dissolved solids, and total metals by Test America Laboratories, Inc. (Test America) located in Canton, Ohio and radium by Test America located in St. Louis, Missouri. The laboratory analytical results are reported in laboratory report J96445-1.

During the May 2018 sampling event, a groundwater sample was collected from each of the following wells:

- MW-16-01
- MW-16-03
- MW-17-07
- MW-16-02
- MW-17-06

In addition, a groundwater sample was collected in non-compliance monitoring well MW-16-04S which was submitted for analysis along with the compliance well samples and are included for quality review purposes.

Each sample was analyzed for the following constituents:

Analyte Group	Method
Anions (Fluoride, Chloride, Sulfate)	EPA 9056A
Total Dissolved Solids	SM 2540C
Total Metals	EPA 6010B, EPA 6020, EPA 7470A
Radium (Radium-226, Radium-228, Total Radium)	SW846 9315, SW846 9320

TRC reviewed the laboratory data to assess data usability. The following sections summarize the data review procedure and the results of the review.

Data Quality Review Procedure

The analytical data were reviewed using the USEPA National Functional Guidelines for Inorganic Superfund Data Review (USEPA, 2017) and the Department of Energy Evaluation of Radiochemical Data Usability (USDOE, 1997). The following items were included in the evaluation of the data:

- Sample receipt, as noted in the cover page or case narrative;
- Technical holding times for analyses;
- Reporting limits (RLs) compared to project-required RLs;
- Data for method blanks. Method blanks are used to assess potential contamination arising from laboratory sample preparation and/or analytical procedures;

- Data for laboratory control samples (LCSs). The LCSs are used to assess the accuracy of the analytical method using a clean matrix;
- Data for blind field duplicates. Field duplicate samples are used to assess variability introduced by the sampling and analytical processes;
- Percent recoveries for the carriers for radium-226 and radium-228 analyses; and
- Overall usability of the data.

This data usability report addresses the following items:

- Usability of the data if quality control (QC) results suggest potential problems with all or some of the data;
- Actions regarding specific QC criteria exceedances.

Review Summary

The data quality objectives and laboratory completeness goals for the project were met, and the data are usable for their intended purpose. A summary of the data quality review, including non-conformances and issues identified in this evaluation are noted below.

- Appendix IV constituents will be utilized for the purposes of an assessment monitoring program.
- Data are usable for the purposes of the assessment monitoring program.
- When the data are evaluated through an assessment monitoring statistical program, findings below may be used to support the removal of outliers.

QA/QC Sample Summary:

- The boron concentration in the method blank associated with prep batch 329849 was 34.9 J µg/L. Boron results that are $\leq 10x$ the method blank concentration may be false positives. The boron results in samples MW-16-03 and MW-17-06 were less than 10x the method blank concentration; therefore, these results may be false positives. However, the concentration of boron in the sample from MW-17-06 was within the historical range of boron concentrations measured at that well. The boron concentration at MW-16-03 was significantly lower than the historical boron concentrations detected at that well, this is likely due to the operation of the groundwater extraction system installed around the bottom ash basin.
- The percent recoveries for the carriers for radium-226 and radium-228 analyses were within QC limits.
- LCS recoveries and RPDs were within laboratory control limits.
- The field duplicate pair samples were Dup-01 and MW-16-04S. The relative percent differences (RPDs) between the parent and duplicate sample were within QC limits.

Laboratory Data Quality Review

Groundwater Monitoring Event October 2018

DTE Electric Company River Rouge Power Plant (DTE RRPP)

Groundwater samples were collected by TRC for the October 2018 sampling event for the Bottom Ash Basin at the DTE RRPP. Samples were analyzed for anions, total dissolved solids, and select total metals by Test America Laboratories, Inc. (Test America) located in North Canton, Ohio and radium by Test America located in St. Louis, Missouri. The laboratory analytical results are reported in laboratory reports 240-102982-1 and 240-102982-3.

During the October 2018 sampling event, a groundwater sample was collected from each of the following compliance wells:

- MW-16-01
- MW-16-02
- MW-16-03
- MW-17-06
- MW-17-07

During the October 2018 sampling event, a groundwater sample was also collected from each of the following nature and extent wells:

- MW-17-05
- MW-17-13
- MW-17-14
- MW-17-15
- MW-17-18
- MW-17-20

In addition, a groundwater sample was collected from non-compliance monitoring well MW-16-04S which was submitted for analysis along with the compliance well samples and are included for quality review purposes.

Each sample was analyzed for one or more of the following constituents:

Analyte Group	Method
Anions (Fluoride, Chloride, Sulfate)	SW846 9056A
Total Dissolved Solids (TDS)	SM 2540C
Total Metals	SW846 6010B, SW846 6020
Radium (Radium-226, Radium-228, Total Radium)	SW846 9315, SW846 9320

TRC reviewed the laboratory data to assess data usability. The following sections summarize the data review procedure and the results of the review.

Data Quality Review Procedure

The analytical data were reviewed using the USEPA National Functional Guidelines for Inorganic Superfund Data Review (USEPA, 2017) and the Department of Energy Evaluation of

Radiochemical Data Usability (USDOE, 1997). The following items were included in the evaluation of the data:

- Sample receipt, as noted in the cover page or case narrative;
- Technical holding times for analyses;
- Reporting limits (RLs) compared to project-required RLs;
- Data for method blanks. Method blanks are used to assess potential contamination arising from laboratory sample preparation and/or analytical procedures;
- Data for laboratory control samples (LCSs) and laboratory control sample duplicates (LCSDs). The LCS/LCSDs are used to assess the accuracy and precision of the analytical method using a clean matrix;
- Percent recoveries for matrix spike (MS) and matrix spike duplicates (MSD). Percent recoveries are calculated for each analyte spiked and used to assess bias due to sample matrix effects;
- Data for blind field duplicates. Field duplicate samples are used to assess variability introduced by the sampling and analytical processes;
- Percent recoveries for the carriers for radium-226 and radium-228 analyses; and
- Overall usability of the data.

This data usability report addresses the following items:

- Usability of the data if quality control (QC) results suggest potential problems with all or some of the data;
- Actions regarding specific QC criteria exceedances.

Review Summary

The data quality objectives and laboratory completeness goals for the project were met, and the data are usable for their intended purpose. A summary of the data quality review, including non-conformances and issues identified in this evaluation are noted below.

- The reviewed Appendix III and IV constituents will be utilized for the purposes of an assessment monitoring program.
- Data are usable for the purposes of the assessment monitoring program.
- When the data are evaluated through an assessment monitoring statistical program, findings below may be used to support the removal of outliers.

QA/QC Sample Summary:

- A method blank was analyzed with each analytical batch. No target analytes were detected in the method blanks.

- The percent recoveries for the carriers for radium-226 and radium-228 analyses were within acceptance limits.
- LCS and/or LCSD recoveries and relative percent differences (RPDs), where applicable, were within laboratory acceptance limits.
- MS/MSD analyses were performed on sample MW-16-02 for anions. All recoveries and RPDs were within the acceptance limits.
- The field duplicate pair samples were Dup-01/MW-16-03 and Dup-02/MW-17-14. The RPDs and/or duplicate error ratios (DERs) between the parent and duplicate samples were within acceptance limits.
- A constant weight was not achieved after three drying cycles for the TDS analysis of sample MW-17-18. The positive result for TDS in this sample was potentially impacted, as summarized in Attachment A.

Attachment B
Summary of Data Non-Conformances for Groundwater Analytical Data
DTE RRPP – RCRA CCR Monitoring Program
River Rouge, Michigan

Samples	Collection Date	Analyte	Non-Conformance/Issue
MW-17-18_20181015	10/15/2018	Total Dissolved Solids	A constant weight was not achieved after 3 drying cycles. Potential uncertainty exists for total dissolved solids result due to the variability.

Appendix IV Assessment Monitoring Statistical
Evaluation – May 2018 Data

Technical Memorandum

Date: October 15, 2018

To: DTE Electric Company

From: Darby Litz, TRC
Sarah Holmstrom, TRC
Kristin Lowery, TRC

Project No.: 265996.0005.0000 Phase 002, Task 001

Subject: Appendix IV Assessment Monitoring Statistical Evaluation – DTE Electric Company, River Rouge Power Plant, Bottom Ash Basin Coal Combustion Residual Unit

Introduction

On April 17, 2015, the United States Environmental Protection Agency (USEPA) published the final rule for the regulation and management of Coal Combustion Residuals (CCR) under the Resource Conservation and Recovery Act (RCRA) (the CCR Rule). The CCR Rule, which became effective on October 19, 2015, applies to DTE Electric Company (DTE Electric) River Rouge Power Plant (RRPP) Coal Combustion Residual Bottom Ash Basin (BAB) CCR unit located in River Rouge, Michigan (the Site).

During the first detection monitoring event for DTE Electric RRPP BAB CCR unit, several Appendix III constituents were observed in downgradient monitoring wells at concentrations constituting statistically significant increases (SSIs) over the background concentrations established for the site. TRC reported the SSIs for the Bottom Ash Basin in the 2017 *Annual Groundwater Monitoring Report* on behalf of DTE Electric in accordance with the requirements of §257.90(e). In response to the SSIs over background limits noted during the detection monitoring event, DTE Electric initiated assessment monitoring. During the 90-day period after triggering assessment monitoring, groundwater samples were collected from the groundwater monitoring system wells (April 6, 2018) and analyzed for Appendix IV constituents pursuant to §257.95(b). The results from the initial assessment monitoring sampling event were used to establish groundwater protection standards (GWPSs) for the Appendix IV constituents in accordance with §257.95(h). The monitoring system was subsequently sampled for the Appendix III and Appendix IV constituents within 90 days from the initial Appendix IV sampling event (May 30, 2018). In accordance with §257.95, the assessment monitoring data must be compared to Groundwater Protection Standards (GWPSs) to determine whether or not Appendix IV constituents

Technical Memorandum

are detected at statistically significant levels above the GWPSs. This memorandum presents the limits derived for the Appendix IV parameters for the RRPP BAB CCR unit that will be used to compare to the GWPSs.

Assessment Monitoring Statistical Evaluation

The three compliance wells utilized for the BABs CCR Unit includes MW-16-01, MW-16-02 and MW-16-03. Following the initial and resample assessment monitoring sampling event, compliance well data for the RRPP BAB were evaluated in accordance with the *Groundwater Statistical Evaluation Plan* (Stats Plan) (TRC, October 2017; Revised December 2017). For each detected constituent, the concentrations for each well were first compared directly to the GWPS. Parameter-well combinations that included a direct exceedance of the GWPS were retained for further analysis. As a result, arsenic was retained for evaluation at MW-16-01 and MW-16-03, beryllium at MW-16-02, and lithium at MW-16-01, MW-16-02, and MW-16-03.

Groundwater data were then evaluated utilizing ChemStat™ statistical software. ChemStat™ is a software tool that is commercially available for performing statistical evaluation consistent with procedures outlined in U.S. EPA's Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities (Unified Guidance; UG). Within the ChemStat™ statistical program (and the UG), confidence limits were selected to perform the statistical comparison of compliance data to a fixed standard. Parametric and non-parametric confidence intervals were calculated for each of the CCR Appendix IV parameters using a 99 percent confidence level, i.e., a significance level (α) of 0.01. The following narrative describes the methods employed, the results obtained and the ChemStat™ output files are included as an attachment.

The statistical data evaluation included the following steps:

- Review of data quality checklists for the baseline/background data sets for CCR Appendix IV constituents;
- Evaluation of percentage of non-detects for each baseline/background well-constituent (w/c) pair;
- Graphical representation of the baseline data as time versus concentration (T v. C) by well/constituent pair;
- Outlier testing of individual data points that appear from the graphical representations as potential outliers;
- Evaluation of visual trends apparent in the graphical representations for statistical significance;
- Distribution of the data; and
- Calculation of the confidence intervals for each cumulative dataset.

The results of these evaluations are presented and discussed below.

Technical Memorandum

Data Quality

Data from each sampling round were evaluated for completeness, overall quality and usability, method-specified sample holding times, precision and accuracy, and potential sample contamination. The review was completed using the following quality control (QC) information which at a minimum included chain-of-custody forms, investigative sample results including blind field duplicates, and, as provided by the laboratory, method blanks, laboratory control spikes, laboratory duplicates. The data were found to be complete and usable for the purposes of the CCR monitoring program.

Percentage of Non-detects

The percentage of non-detect observations for constituents with one or more detection above a GWPS is included in Table 1. Non-detect data was handled in accordance with the Stats Plan for the purposes of calculating confidence intervals.

Time versus Concentration Graphs

The T v. C graphs show potential outliers for arsenic (high values for MW-16-01 in April and May 2018, and high value for MW-16-03 in September 2016) and beryllium (single detection in MW-16-02 in June 2017). This data set was tested using the ChemStat™ software to assess whether the potential outliers are statistically significant, as discussed further below.

The T v. C graphs showed potential trending for some Appendix IV well/constituent pairs. These were tested by the ChemStat™ software to assess whether the trends are statistically significant.

Outlier Testing

The Dixon's Outlier Test in ChemStat™ was used to test the potential outliers in the arsenic data set for MW-16-01 and MW-16-03 that were identified in the T v. C graphs. The suspect data points for MW-16-01 were found to not be outliers at the 0.05 significance level; therefore, the potential outliers were not confirmed and not removed from the data set. The suspect data point for MW-16-03 was found to be an outlier at the 0.05 significance level and was removed from the data set.

The Dixon's Outlier Test could not be used on the suspected beryllium outlier due to the high percentage of non-detects. Therefore, the single detection was classified as an outlier and removed from the data set.

Trend Analysis

Visual trends apparent in the T v. C graphs were evaluated in ChemStat™ using the Sens Slope estimator to determine if a subset of data should be used in calculating the confidence interval. Trends were evaluated using a 95-percent (two-tailed) confidence level, i.e., a significance level (α) of 0.05. No trends were found to be significant.

Technical Memorandum

Distribution of the Data Sets

ChemStat™ was utilized to evaluate each data set for normality. If the skewness coefficient was calculated to be between negative one and one, then the data were assumed to be approximately normally distributed. If the skewness coefficient was calculated as greater than one (or less than negative one) then the calculation was performed on the natural log (Ln) of the data. If the Ln of the data still determined that the data appeared to be skewed, then the Shapiro-Wilk test of normality (Shapiro-Wilk) was performed. The Shapiro-Wilk statistic was calculated on both non-transformed data, and the Ln-transformed data. If the Shapiro-Wilk statistic indicated that normal distributional assumptions were not valid, then the parameter was considered a candidate for non-parametric statistical evaluation. The data distributions are summarized in Table 1.

Confidence Intervals

Table 1 presents the calculated confidence intervals for each well-constituent pair. For normal and lognormal distributions, confidence intervals are calculated for 99 percent confidence using parametric methods. For non-normal background datasets, a nonparametric confidence interval is utilized, resulting in the highest and lowest values from the contributing dataset as the confidence limits. Confidence intervals were calculated using only the eight most recent sampling events to ensure that data was recent enough to be representative of current site conditions.

The confidence intervals calculated through the above-described process will be compared to the GWPS to determine if an exceedance has occurred. An exceedance of the standard occurs when the 99 percent lower confidence level of the downgradient data exceeds the GWPS. If the statistical tests conclude that an exceedance of the GWPS, verification resampling may be conducted by the facility. Once the resampling data are available, the comparison to the GWPS will be evaluated.

 Summary of Descriptive Statistics and Confidence Interval Calculations
 Assessment Monitoring Statistical Evaluation
 DTE Electric Company – River Rouge Power Plant

Parameter ⁽¹⁾	Percent Non-Detect	Outliers?	Trend?	Skewness		Shapiro-Wilks Test (5% Critical Value)		Parametric / Non-Parametric	Confidence Interval ⁽²⁾
				Un-Transformed	Natural Log	Un-Transformed	Natural Log		
MW-16-01									
Arsenic	0%	No	No	1 < 1.1593	1 < 1.14357	0.818 > 0.603872	0.818 > 0.629581	Non-parametric	[35, 170]
Lithium	0%	No	No	-1 < -0.815305 < 1	--	--	--	Parametric	[47, 52]
MW-16-02									
Beryllium	88%	Yes ⁽³⁾	--	--	--	--	--	--	--
Lithium	0%	No	No	-1 < -0.997215 < 1	--	--	--	Parametric	[41, 70]
MW-16-03									
Arsenic	22%	Yes	No	-1 < 0.480136 < 1	--	--	--	Parametric	[4.0, 17]
Lithium	0%	No	No	-1.03428 < -1	-1.17372 < -1	0.818 > 0.752255	0.818 > 0.698096	Non-parametric	[11, 51]

Notes:

- (1) Well-parameter combinations that have one or more direct exceedances of the Groundwater Protection Standard.
- (2) The most recent eight data points are used to calculate the confidence interval to be representative of current conditions.
- (3) The beryllium outlier is a single detection. With the outlier removed, the dataset is 100% non-detects; therefore, further analysis is unnecessary.

Kristin Lowery, TRC

Project No.: 265996.0005.0000 Phase 002, Task 001

Subject: Appendix IV Assessment Monitoring Statistical Evaluation for October 2018
Groundwater Monitoring Event – DTE Electric Company, River Rouge Power Plant,
Bottom Ash Basin Coal Combustion Residual Unit

Introduction

On April 17, 2015, the United States Environmental Protection Agency (USEPA) published the final rule for the regulation and management of Coal Combustion Residuals (CCR) under the Resource Conservation and Recovery Act (RCRA) (the CCR Rule), as amended July 30, 2018. The CCR Rule, which became effective on October 19, 2015 (amendment effective August 29, 2018), applies to DTE Electric Company (DTE Electric) River Rouge Power Plant (RRPP) Coal Combustion Residual Bottom Ash Basin (BAB) CCR unit located in River Rouge, Michigan (the Site).

In response to the statistically significant increases (SSIs) above background for boron, fluoride and pH, DTE Electric established an Assessment Monitoring Program for the RRPP BAB CCR unit pursuant to §257.94(e) of the CCR Rule as presented in the April 13, 2018 *Establishment of an Assessment Monitoring Program River Rouge Power Plant Bottom Ash Basin Coal Combustion Residual Unit* letter. In accordance with §257.95, TRC conducted two assessment monitoring events, a preliminary and subsequent initial semiannual assessment monitoring event, at the RRPP BAB CCR unit. The preliminary Appendix IV only assessment monitoring event (per §257.95(b)) was performed on April 6, 2018, and the subsequent initial semiannual assessment monitoring event (per §257.95(d), Appendix III and IV parameters) was performed on May 30 and 31, 2018. The results from the initial assessment monitoring sampling event were used to establish groundwater protection standards (GWPSs) for the Appendix IV constituents in accordance with §257.95(h). The results from the assessment monitoring sampling events were subsequently used to perform the statistical comparison to the established GWPSs.

Technical Memorandum

On October 15, 2018, it was determined that pursuant to §257.93 (h) that arsenic and lithium are present at statistically significant levels above their respective GWPSs at one or more down gradient well locations at the RRPP BAB CCR unit¹.

Although DTE Electric will proceed with assessment of corrective measures per §257.95(g)(3), DTE Electric is currently operating a groundwater extraction system as a presumptive remedy to maintain hydraulic control around the RRPP BAB to address the uncertainty around the potential migration of CCR constituents from the RRPP BAB to groundwater. This system has effectively captured groundwater in the vicinity of the RRPP BAB CCR unit since it began operation on March 2, 2018, and eliminates the potential for Appendix III and Appendix IV parameters to migrate from the RRPP BAB CCR unit.

In accordance with §257.96(b), DTE Electric is continuing assessment monitoring for the RRPP BAB CCR unit. The second semiannual assessment monitoring event for the Appendix III and detected Appendix IV constituents was conducted on October 16, 2018. In accordance with §257.95, the assessment monitoring data must be compared to determine whether or not Appendix IV constituents are detected at statistically significant levels above the GWPSs. This memorandum presents the limits derived for the Appendix IV parameters for the RRPP BAB CCR unit that will be used to compare to the GWPSs.

Assessment Monitoring Statistical Evaluation

The three compliance wells utilized for the BAB CCR Unit are MW-16-01, MW-16-02 and MW-16-03. Following the second semiannual assessment monitoring sampling event, compliance well data for the RRPP BAB were evaluated in accordance with the *Groundwater Statistical Evaluation Plan (Stats Plan)* (TRC, October 2017; Revised December 2017). For each detected constituent, the concentrations for each well were first compared directly to the GWPS within a rolling window of eight sampling events. Parameter-well combinations that included a direct exceedance of the GWPS were retained for further analysis. As a result, arsenic was retained for evaluation at MW-16-01, beryllium at MW-16-02, and lithium at MW-16-01, MW-16-02, and MW-16-03.

Groundwater data were then evaluated utilizing ChemStat™ statistical software. ChemStat™ is a software tool that is commercially available for performing statistical evaluation consistent with procedures outlined in U.S. EPA's *Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities (Unified Guidance; UG)*. Within the ChemStat™ statistical program (and the UG), confidence limits were selected to perform the statistical comparison of compliance data to a fixed standard. Parametric and non-parametric confidence intervals were calculated for each of the CCR Appendix IV parameters using a 99 percent confidence level, i.e., a significance level (α) of 0.01. The

Technical Memorandum

following narrative describes the methods employed, the results obtained and the ChemStat™ output files are included as an attachment.

Due to the initiation of operation of the groundwater extraction system to establish groundwater capture in the area of the BAB in March of 2018 and subsequent changes in groundwater flow rate and direction, the data set used for statistical evaluation was limited to the four most recent events. Use of the four most recent data points provides the minimum density of data as recommended per the UG and is representative of current conditions at the BAB under the hydraulic influence of the groundwater extraction system.

The statistical data evaluation included the following steps:

- Review of data quality checklists for the baseline/background data sets for CCR Appendix IV constituents;
- Evaluation of percentage of non-detects for each baseline/background well-constituent pair;
- Graphical representation of the baseline data as time versus concentration (T v. C) by well/constituent pair;
- Outlier testing of individual data points that appear from the graphical representations as potential outliers;
- Evaluation of visual trends apparent in the graphical representations for statistical significance;
- Distribution of the data; and
- Calculation of the confidence intervals for each cumulative dataset.

The results of these evaluations are presented and discussed below.

Data Quality

Data from each sampling round were evaluated for completeness, overall quality and usability, method-specified sample holding times, precision and accuracy, and potential sample contamination. The review was completed using the following quality control (QC) information which at a minimum included chain-of-custody forms, investigative sample results including blind field duplicates, and, as provided by the laboratory, method blanks, laboratory control spikes, laboratory duplicates. The data were found to be complete and usable for the purposes of the CCR monitoring program.

Percentage of Non-detects

The percentage of non-detect observations for constituents with one or more detection above a GWPS is included in Table 1. Non-detect data was handled in accordance with the Stats Plan for the purposes of calculating confidence intervals.

Technical Memorandum

Time versus Concentration Graphs

The T v. C graphs show a potential outlier for beryllium (single detection in MW-16-02 in June 2017). This data set was tested using the ChemStat™ software to assess whether the potential outliers are statistically significant, as discussed further below.

The T v. C graphs showed potential trending for some Appendix IV well/constituent pairs. These were tested by the ChemStat™ software to assess whether the trends are statistically significant.

Outlier Testing

The Dixon's Outlier Test in ChemStat™ could not be used on the suspected beryllium outlier due to the high percentage of non-detects. Therefore, the single detection was classified as an outlier and removed from the data set, per the double quantification rule as outlined in the UG.

Trend Analysis

Visual trends apparent in the T v. C graphs were evaluated in ChemStat™ using the Sens Slope estimator to determine if a subset of data should be used in calculating the confidence interval. Trends were evaluated using a 95-percent (two-tailed) confidence level, i.e., a significance level (α) of 0.05. Statistically significant decreasing trends were found in lithium at MW-16-02 and MW-16-03. These lithium decreasing trends will continue to be monitored and are likely resulting from changes in groundwater quality due to operation of the groundwater extraction system.

Distribution of the Data Sets

ChemStat™ was utilized to evaluate each data set for normality. If the skewness coefficient was calculated to be between negative one and one, then the data were assumed to be approximately normally distributed. If the skewness coefficient was calculated as greater than one (or less than negative one) then the calculation was performed on the natural log (Ln) of the data. If the Ln of the data still determined that the data appeared to be skewed, then the Shapiro-Wilk test of normality (Shapiro-Wilk) was performed. The Shapiro-Wilk statistic was calculated on both non-transformed data, and the Ln-transformed data. If the Shapiro-Wilk statistic indicated that normal distributional assumptions were not valid, then the parameter was considered a candidate for non-parametric statistical evaluation. The data distributions are summarized in Table 1.

Confidence Intervals

Variability is recognized in the data set due to changing groundwater quality in response to the operation of the groundwater extraction system. Calculating a confidence interval around a trending data set incorporates not only variability present naturally in the underlying dataset, but can exaggerate variability. The downward trend in lithium concentrations at MW-16-02 and MW-16-03 are likely causing the confidence interval to be much wider than expected given the confidence level (e.g., 99%) and sample size (n=4). However, lithium concentrations have already triggered

Technical Memorandum

assessment monitoring (e.g., not a newly identified GWPS exceedance) and remedial efforts are ongoing; therefore, traditional confidence interval calculations are presented in this statistical evaluation until more data are available. Once groundwater conditions stabilize under the current system operation with a more consistent trend, and additional post-treatment data are collected, confidence bands may be a more appropriate option to determine compliance with the CCR Rule. Confidence bands are selected by the UG as the appropriate method for calculating confidence intervals on trending data. A confidence band calculates upper and lower confidence limits at each point along the trend to reduce variability and create a narrower confidence interval. At least 8 to 10 measurements should be available when computing a confidence band around a linear regression.

Table 1 presents the calculated confidence intervals for each well-constituent pair. For normal and lognormal distributions, confidence intervals are calculated for 99 percent confidence using parametric methods. For non-normal background datasets, a nonparametric confidence interval is utilized, resulting in the highest and lowest values from the contributing dataset as the confidence limits. Confidence intervals were calculated using only the four most recent sampling events to ensure that data was recent enough to be representative of current site conditions.

The confidence intervals calculated through the above-described process will be compared to the GWPS to determine if an exceedance has occurred. An exceedance of the standard occurs when the 99 percent lower confidence level of the downgradient data exceeds the GWPS. If the statistical tests conclude that an exceedance of the GWPS, verification resampling may be conducted by the facility. Once the resampling data are available, the comparison to the GWPS will be evaluated.

Beryllium	89%	Yes ⁽³⁾	--	--	--	--	--	--	--
Lithium	0%	No	Yes	-1 < 0.150305 < 1	--	--	--	Parametric	[10, 66]
MW-16-03									
Lithium	9%	No	Yes	-1 < 0.880396 < 1	--	--	--	Parametric	[-19, 54]

Notes:

- (1) Well-parameter combinations that have one or more direct exceedances of the Groundwater Protection Standard within a rolling window of eight sampling events.
- (2) The most recent four data points are used to calculate the confidence interval to be representative of current conditions.
- (3) The beryllium outlier is a single detection. With the outlier removed, the dataset is 100% non-detects; therefore, further analysis is unnecessary.
